Skill 10

Think Probabilistically

How Likely Is It?

160 Items	**1-5** Levels	**Choose the answer that handles chance and uncertainty well.** Objective

Essential question. How should uncertainty affect what we expect?

This PDF is designed for classroom use. It gives teachers a rigorous introduction to the skill, a repeatable solving routine, likely student confusions, a worked example, and the full XiXteen item set with choice-level feedback.

Generated from the current XiXteen corpus on 2026-10-29.

Skill 10

Think Probabilistically

How Likely Is It?

Choose the answer that handles chance and uncertainty well. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	How should uncertainty affect what we expect?
Why it matters	Probability helps people think between impossible and guaranteed. Many real decisions involve signals, forecasts, false alarms, base rates, and uncertainty rather than proof.
Conceptual core	Probability gives students language for partial belief. Many claims are neither proved nor disproved; they are more or less likely given the information available. Students need to distinguish chance from certainty, risk from outcome, signal from guarantee, and individual cases from long-run frequencies. This is essential for forecasts, tests, warnings, and everyday planning.
Student method	Translate percentages into out-of-100 language. Ask whether the number is a chance, a frequency, a warning signal, or a guarantee. Keep uncertainty visible.
Analogy	Probability is a weather forecast for belief. A 70 percent chance of rain matters, but it is not the same as rain already falling.
Assessment focus	A good answer uses the probability as evidence without turning it into certainty or dismissing it as useless.

Teaching Sequence

1. Translate percentages into out-of-100 language.

2. Ask whether the number describes a chance, a frequency, a false alarm rate, or a prediction.

3. Keep likely separate from certain and unlikely separate from impossible.

4. Notice when the evidence changes odds without settling the result.

Common Confusions To Watch For

1. Students may treat a high probability as a guarantee.

2. Students may treat a low probability as impossible.

3. Students may ignore the base rate or the group the probability applies to.

Teacher Prompts

1. Out of 100 similar cases, about how many would we expect?

2. Does this number tell us what will happen here, or how often it tends to happen?

3. What uncertainty remains?

Worked Example

Scenario	A weather app says there is a 70 percent chance of rain in town tomorrow.
Teacher think-aloud	That does not mean it will rain for 70 percent of the day or that rain is guaranteed. It means that in similar forecast situations, rain would occur about 70 out of 100 times.
Student takeaway	Probability guides expectations while leaving room for uncertainty.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A weather app assigns a 70% chance of measurable rain tomorrow. For this exercise, measurable rain means at least 1 mm at the town weather station during that calendar day. Imagine 100 comparable forecasts, each issued a day ahead at 70%, from a well-calibrated app: its stated probabilities match long-run frequencies.

What To Do

1. Write approximately how many of those 100 days should have measurable rain and how many should not.

2. Explain why a dry tomorrow would not by itself refute a 70% forecast.

3. Write what record you would inspect to judge whether the app's 70% forecasts are well calibrated.

Check before reading the answer. Do not treat 70% as a guarantee, a claim about 70% of the town, or a claim that rain lasts 70% of the day.

Model Answer

About 70 days should have measurable rain and about 30 should not; exact counts can vary. A dry tomorrow is allowed by the 30% chance of no rain. I would inspect many comparable forecasts recorded in advance at 70%, keeping dry days as well as wet ones, and compare their rain frequency with 70%.

Why it is adequate. It identifies the event and reference group and evaluates a probabilistic claim across a record rather than a single outcome.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

probability-001 | Level 1 | Answer A

Prompt. A month-ahead forecast for evening bus service for late-shift workers says the chance is 25 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 25 out of 100 times. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, transportation, d1, p25

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-002 | Level 1 | Answer B

Prompt. A month-ahead forecast for classroom phone lockers says the chance is 30 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** If there were 100 similar forecasts, about 30 would be expected to improve. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d1, p30

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-003 | Level 1 | Answer C

Prompt. A month-ahead forecast for medication reminder texts for older patients says the chance is 40 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d1, p40

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-004 | Level 1 | Answer D

Prompt. A month-ahead forecast for a four-day workweek test for software engineers says the chance is 55 out of 100 that staff resignations will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** It leaves room for the result not to happen, because 55% is a chance rather than a promise. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace, d1, p55

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-005 | Level 1 | Answer A

Prompt. A month-ahead forecast for larger grocery unit-price labels says the chance is 60 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, retail, d1, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-006 | Level 1 | Answer B

Prompt. A month-ahead forecast for late fines on children's books says the chance is 65 out of 100 that library card renewals will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** Out of 100 cases like this, roughly 65 would be expected to improve. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public services, d1, p65

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-007 | Level 1 | Answer C

Prompt. A month-ahead forecast for two-factor login for site administrators says the chance is 70 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. A 70-out-of-100 chance means the result may happen, but it may not. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, technology, d1, p70

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-008 | Level 1 | Answer D

Prompt. A month-ahead forecast for brighter streetlights on Maple Street says the chance is 75 out of 100 that reported thefts will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public safety, d1, p75

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-009 | Level 1 | Answer C

Prompt. A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 80 out of 100 that course pass rates will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. About 80 of 100 similar situations would be expected to show the improvement. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-010 | Level 1 | Answer D

Prompt. A month-ahead forecast for calorie labels on restaurant menus says the chance is 85 out of 100 that dessert orders will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** This is a likelihood estimate: the result is possible, not certain. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-011 | Level 1 | Answer B

Prompt. A month-ahead forecast for bank overdraft warning texts says the chance is 90 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** In many similar cases, the improvement would happen about 90 out of 100 times. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, finance, d1, p90

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-012 | Level 1 | Answer D

Prompt. A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 15 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** If there were 100 similar forecasts, about 15 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d1, p15

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-013 | Level 1 | Answer B

Prompt. A month-ahead forecast for free Friday museum admission says the chance is 35 out of 100 that family visits will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-014 | Level 1 | Answer A

Prompt. A month-ahead forecast for youth soccer concussion checks says the chance is 45 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. It leaves room for the result not to happen, because 45% is a chance rather than a promise. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-016 | Level 1 | Answer D

Prompt. A month-ahead forecast for warehouse ergonomic training says the chance is 20 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** Out of 100 cases like this, roughly 20 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace safety, d1, p20

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-017 | Level 1 | Answer B

Prompt. A month-ahead forecast for apartment-lobby compost bins says the chance is 25 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** A 25-out-of-100 chance means the result may happen, but it may not. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d1, p25

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-018 | Level 1 | Answer D

Prompt. A month-ahead forecast for private-by-default app profiles says the chance is 30 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-019 | Level 1 | Answer D

Prompt. A month-ahead forecast for same-day clinic appointment slots says the chance is 40 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** About 40 of 100 similar situations would be expected to show the improvement. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d1, p40

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-020 | Level 1 | Answer C

Prompt. A month-ahead forecast for seat-zone airline boarding says the chance is 55 out of 100 that average boarding time will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. This is a likelihood estimate: the result is possible, not certain. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-021 | Level 1 | Answer A

Prompt. A month-ahead forecast for an online apartment repair portal says the chance is 60 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 60 out of 100 times. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, housing, d1, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-022 | Level 1 | Answer B

Prompt. A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 65 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** If there were 100 similar forecasts, about 65 would be expected to improve. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, food, d1, p65

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-023 | Level 1 | Answer C

Prompt. A month-ahead forecast for weekly call-center script coaching says the chance is 70 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast says improvement is possible but not guaranteed: about 70 chances in 100. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, customer support, d1, p70

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-024 | Level 1 | Answer D

Prompt. A month-ahead forecast for household water-leak alerts says the chance is 75 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** It leaves room for the result not to happen, because 75% is a chance rather than a promise. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, utilities, d1, p75

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-025 | Level 1 | Answer C

Prompt. A month-ahead forecast for body-camera activation reminders says the chance is 80 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The number estimates how often this improvement would happen across many similar cases. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, governance, d1, p80

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-026 | Level 1 | Answer A

Prompt. A month-ahead forecast for county mail-ballot tracking says the chance is 85 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. Out of 100 cases like this, roughly 85 would be expected to improve. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, election administration, d1, p85

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-027 | Level 1 | Answer C

Prompt. A month-ahead forecast for language-learning spaced-review prompts says the chance is 90 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. A 90-out-of-100 chance means the result may happen, but it may not. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, learning, d1, p90

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-028 | Level 1 | Answer A

Prompt. A month-ahead forecast for a beginner gym orientation says the chance is 15 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The percentage describes a chance across repeated similar cases, not a promise for this one. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, fitness, d1, p15

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-029 | Level 1 | Answer C

Prompt. A month-ahead forecast for safe-driving feedback for policyholders says the chance is 35 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. About 35 of 100 similar situations would be expected to show the improvement. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, insurance, d1, p35

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-030 | Level 1 | Answer A

Prompt. A month-ahead forecast for top-of-article correction boxes says the chance is 45 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. This is a likelihood estimate: the result is possible, not certain. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, media, d1, p45

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-031 | Level 1 | Answer B

Prompt. A month-ahead forecast for clearer farmers market price signs says the chance is 50 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** In many similar cases, the improvement would happen about 50 out of 100 times. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, local commerce, d1, p50

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-032 | Level 1 | Answer A

Prompt. A month-ahead forecast for hotel quiet-hours text reminders says the chance is 20 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. If there were 100 similar forecasts, about 20 would be expected to improve. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, hospitality, d1, p20

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

probability-033 | Level 2 | Answer D

Prompt. A month-ahead forecast for evening bus service for late-shift workers says the chance is 30 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** If there were 100 similar forecasts, about 30 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, transportation, d2, p30

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-034 | Level 2 | Answer C

Prompt. A month-ahead forecast for classroom phone lockers says the chance is 40 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d2, p40

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-035 | Level 2 | Answer B

Prompt. A month-ahead forecast for medication reminder texts for older patients says the chance is 55 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** It leaves room for the result not to happen, because 55% is a chance rather than a promise. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d2, p55

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-036 | Level 2 | Answer A

Prompt. A month-ahead forecast for a four-day workweek test for software engineers says the chance is 60 out of 100 that staff resignations will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace, d2, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-037 | Level 2 | Answer D

Prompt. A month-ahead forecast for larger grocery unit-price labels says the chance is 65 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** Out of 100 cases like this, roughly 65 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, retail, d2, p65

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-038 | Level 2 | Answer C

Prompt. A month-ahead forecast for late fines on children's books says the chance is 70 out of 100 that library card renewals will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. A 70-out-of-100 chance means the result may happen, but it may not. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public services, d2, p70

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-039 | Level 2 | Answer B

Prompt. A month-ahead forecast for two-factor login for site administrators says the chance is 75 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, technology, d2, p75

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-040 | Level 2 | Answer A

Prompt. A month-ahead forecast for brighter streetlights on Maple Street says the chance is 80 out of 100 that reported thefts will fall. What does that percentage mean?

A. About 80 of 100 similar situations would be expected to show the improvement. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public safety, d2, p80

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-041 | Level 2 | Answer B

Prompt. A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 85 out of 100 that course pass rates will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** This is a likelihood estimate: the result is possible, not certain. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d2, p85

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-042 | Level 2 | Answer A

Prompt. A month-ahead forecast for calorie labels on restaurant menus says the chance is 90 out of 100 that dessert orders will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 90 out of 100 times. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, nutrition, d2, p90

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-043 | Level 2 | Answer C

Prompt. A month-ahead forecast for bank overdraft warning texts says the chance is 15 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. If there were 100 similar forecasts, about 15 would be expected to improve. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, finance, d2, p15

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-044 | Level 2 | Answer D

Prompt. A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 35 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d2, p35

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-045 | Level 2 | Answer A

Prompt. A month-ahead forecast for free Friday museum admission says the chance is 45 out of 100 that family visits will rise. What does that percentage mean?

A. It leaves room for the result not to happen, because 45% is a chance rather than a promise. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, culture, d2, p45

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-046 | Level 2 | Answer B

Prompt. A month-ahead forecast for youth soccer concussion checks says the chance is 50 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The number estimates how often this improvement would happen across many similar cases. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, sports, d2, p50

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-047 | Level 2 | Answer C

Prompt. A month-ahead forecast for same-day donation receipts says the chance is 20 out of 100 that donor retention will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. Out of 100 cases like this, roughly 20 would be expected to improve. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, nonprofit, d2, p20

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-048 | Level 2 | Answer D

Prompt. A month-ahead forecast for warehouse ergonomic training says the chance is 25 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** A 25-out-of-100 chance means the result may happen, but it may not. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace safety, d2, p25

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-049 | Level 2 | Answer A

Prompt. A month-ahead forecast for apartment-lobby compost bins says the chance is 30 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The percentage describes a chance across repeated similar cases, not a promise for this one. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d2, p30

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-050 | Level 2 | Answer B

Prompt. A month-ahead forecast for private-by-default app profiles says the chance is 40 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** About 40 of 100 similar situations would be expected to show the improvement. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, technology, d2, p40

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-051 | Level 2 | Answer C

Prompt. A month-ahead forecast for same-day clinic appointment slots says the chance is 55 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. This is a likelihood estimate: the result is possible, not certain. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d2, p55

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-052 | Level 2 | Answer D

Prompt. A month-ahead forecast for seat-zone airline boarding says the chance is 60 out of 100 that average boarding time will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** In many similar cases, the improvement would happen about 60 out of 100 times. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, travel, d2, p60

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-053 | Level 2 | Answer B

Prompt. A month-ahead forecast for an online apartment repair portal says the chance is 65 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** If there were 100 similar forecasts, about 65 would be expected to improve. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, housing, d2, p65

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-054 | Level 2 | Answer A

Prompt. A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 70 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast says improvement is possible but not guaranteed: about 70 chances in 100. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, food, d2, p70

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-055 | Level 2 | Answer D

Prompt. A month-ahead forecast for weekly call-center script coaching says the chance is 75 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** It leaves room for the result not to happen, because 75% is a chance rather than a promise. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, customer support, d2, p75

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-056 | Level 2 | Answer C

Prompt. A month-ahead forecast for household water-leak alerts says the chance is 80 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The number estimates how often this improvement would happen across many similar cases. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, utilities, d2, p80

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-057 | Level 2 | Answer B

Prompt. A month-ahead forecast for body-camera activation reminders says the chance is 85 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** Out of 100 cases like this, roughly 85 would be expected to improve. correct
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, governance, d2, p85

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-058 | Level 2 | Answer A

Prompt. A month-ahead forecast for county mail-ballot tracking says the chance is 90 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. A 90-out-of-100 chance means the result may happen, but it may not. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, election administration, d2, p90

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-059 | Level 2 | Answer D

Prompt. A month-ahead forecast for language-learning spaced-review prompts says the chance is 15 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, learning, d2, p15

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-060 | Level 2 | Answer C

Prompt. A month-ahead forecast for a beginner gym orientation says the chance is 35 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. About 35 of 100 similar situations would be expected to show the improvement. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, fitness, d2, p35

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-061 | Level 2 | Answer B

Prompt. A month-ahead forecast for safe-driving feedback for policyholders says the chance is 45 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** This is a likelihood estimate: the result is possible, not certain. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, insurance, d2, p45

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-062 | Level 2 | Answer A

Prompt. A month-ahead forecast for top-of-article correction boxes says the chance is 50 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. In many similar cases, the improvement would happen about 50 out of 100 times. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, media, d2, p50

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-063 | Level 2 | Answer C

Prompt. A month-ahead forecast for clearer farmers market price signs says the chance is 20 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. If there were 100 similar forecasts, about 20 would be expected to improve. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, local commerce, d2, p20

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-064 | Level 2 | Answer D

Prompt. A month-ahead forecast for hotel quiet-hours text reminders says the chance is 25 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast says improvement is possible but not guaranteed: about 25 chances in 100. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, hospitality, d2, p25

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

probability-065 | Level 3 | Answer C

Prompt. A month-ahead forecast for evening bus service for late-shift workers says the chance is 40 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, transportation, d3, p40

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-066 | Level 3 | Answer D

Prompt. A month-ahead forecast for classroom phone lockers says the chance is 55 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** It leaves room for the result not to happen, because 55% is a chance rather than a promise. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d3, p55

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-067 | Level 3 | Answer A

Prompt. A month-ahead forecast for medication reminder texts for older patients says the chance is 60 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d3, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-068 | Level 3 | Answer B

Prompt. A month-ahead forecast for a four-day workweek test for software engineers says the chance is 65 out of 100 that staff resignations will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** Out of 100 cases like this, roughly 65 would be expected to improve. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace, d3, p65

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-069 | Level 3 | Answer C

Prompt. A month-ahead forecast for larger grocery unit-price labels says the chance is 70 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. A 70-out-of-100 chance means the result may happen, but it may not. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, retail, d3, p70

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-070 | Level 3 | Answer D

Prompt. A month-ahead forecast for late fines on children's books says the chance is 75 out of 100 that library card renewals will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public services, d3, p75

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-071 | Level 3 | Answer A

Prompt. A month-ahead forecast for two-factor login for site administrators says the chance is 80 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. About 80 of 100 similar situations would be expected to show the improvement. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, technology, d3, p80

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-072 | Level 3 | Answer B

Prompt. A month-ahead forecast for brighter streetlights on Maple Street says the chance is 85 out of 100 that reported thefts will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** This is a likelihood estimate: the result is possible, not certain. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public safety, d3, p85

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-073 | Level 3 | Answer C

Prompt. A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 90 out of 100 that course pass rates will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. In many similar cases, the improvement would happen about 90 out of 100 times. correct	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d3, p90

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-074 | Level 3 | Answer D

Prompt. A month-ahead forecast for calorie labels on restaurant menus says the chance is 15 out of 100 that dessert orders will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** If there were 100 similar forecasts, about 15 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-075 | Level 3 | Answer D

Prompt. A month-ahead forecast for bank overdraft warning texts says the chance is 35 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-076 | Level 3 | Answer C

Prompt. A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 45 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. It leaves room for the result not to happen, because 45% is a chance rather than a promise. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d3, p45

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-077 | Level 3 | Answer B

Prompt. A month-ahead forecast for free Friday museum admission says the chance is 50 out of 100 that family visits will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The number estimates how often this improvement would happen across many similar cases. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, culture, d3, p50

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-078 | Level 3 | Answer A

Prompt. A month-ahead forecast for youth soccer concussion checks says the chance is 20 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. Out of 100 cases like this, roughly 20 would be expected to improve. correct	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, sports, d3, p20

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-079 | Level 3 | Answer D

Prompt. A month-ahead forecast for same-day donation receipts says the chance is 25 out of 100 that donor retention will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** A 25-out-of-100 chance means the result may happen, but it may not. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, nonprofit, d3, p25

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-080 | Level 3 | Answer C

Prompt. A month-ahead forecast for warehouse ergonomic training says the chance is 30 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage describes a chance across repeated similar cases, not a promise for this one. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace safety, d3, p30

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-081 | Level 3 | Answer B

Prompt. A month-ahead forecast for apartment-lobby compost bins says the chance is 40 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** About 40 of 100 similar situations would be expected to show the improvement. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, environment, d3, p40

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-082 | Level 3 | Answer A

Prompt. A month-ahead forecast for private-by-default app profiles says the chance is 55 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. This is a likelihood estimate: the result is possible, not certain. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, technology, d3, p55

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-083 | Level 3 | Answer B

Prompt. A month-ahead forecast for same-day clinic appointment slots says the chance is 60 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** In many similar cases, the improvement would happen about 60 out of 100 times. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d3, p60

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-084 | Level 3 | Answer A

Prompt. A month-ahead forecast for seat-zone airline boarding says the chance is 65 out of 100 that average boarding time will fall. What does that percentage mean?

A. If there were 100 similar forecasts, about 65 would be expected to improve. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The forecast should be ignored unless it says the chance is 100%. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, travel, d3, p65

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

probability-085 | Level 3 | Answer A

Prompt. A month-ahead forecast for an online apartment repair portal says the chance is 70 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. The forecast says improvement is possible but not guaranteed: about 70 chances in 100. correct	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, housing, d3, p70

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-086 | Level 3 | Answer B

Prompt. A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 75 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** It leaves room for the result not to happen, because 75% is a chance rather than a promise. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, food, d3, p75

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-087 | Level 3 | Answer C

Prompt. A month-ahead forecast for weekly call-center script coaching says the chance is 80 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The number estimates how often this improvement would happen across many similar cases. correct	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, customer support, d3, p80

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-088 | Level 3 | Answer D

Prompt. A month-ahead forecast for household water-leak alerts says the chance is 85 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage tells how many people support the plan, not how likely the result is. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** Out of 100 cases like this, roughly 85 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, utilities, d3, p85

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-089 | Level 3 | Answer A

Prompt. A month-ahead forecast for body-camera activation reminders says the chance is 90 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. A 90-out-of-100 chance means the result may happen, but it may not. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, governance, d3, p90

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-090 | Level 3 | Answer B

Prompt. A month-ahead forecast for county mail-ballot tracking says the chance is 15 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The percentage describes a chance across repeated similar cases, not a promise for this one. correct
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, election administration, d3, p15

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-091 | Level 3 | Answer C

Prompt. A month-ahead forecast for language-learning spaced-review prompts says the chance is 35 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. About 35 of 100 similar situations would be expected to show the improvement. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, learning, d3, p35

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-092 | Level 3 | Answer D

Prompt. A month-ahead forecast for a beginner gym orientation says the chance is 45 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** This is a likelihood estimate: the result is possible, not certain. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, fitness, d3, p45

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-093 | Level 3 | Answer C

Prompt. A month-ahead forecast for safe-driving feedback for policyholders says the chance is 50 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected. choice	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. In many similar cases, the improvement would happen about 50 out of 100 times. correct	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, insurance, d3, p50

A feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

probability-094 | Level 3 | Answer D

Prompt. A month-ahead forecast for top-of-article correction boxes says the chance is 20 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is. choice	**B.** The forecast promises what will happen in this one case, so no other result should be expected. choice
C. The forecast should be ignored unless it says the chance is 100%. choice	**D.** If there were 100 similar forecasts, about 20 would be expected to improve. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, media, d3, p20

A feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

B feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

C feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-095 | Level 3 | Answer B

Prompt. A month-ahead forecast for clearer farmers market price signs says the chance is 25 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%. choice	**B.** The forecast says improvement is possible but not guaranteed: about 25 chances in 100. correct
C. The percentage tells how many people support the plan, not how likely the result is. choice	**D.** The forecast promises what will happen in this one case, so no other result should be expected. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, local commerce, d3, p25

A feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

D feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

probability-096 | Level 3 | Answer A

Prompt. A month-ahead forecast for hotel quiet-hours text reminders says the chance is 30 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. It leaves room for the result not to happen, because 30% is a chance rather than a promise. correct	**B.** The forecast should be ignored unless it says the chance is 100%. choice
C. The forecast promises what will happen in this one case, so no other result should be expected. choice	**D.** The percentage tells how many people support the plan, not how likely the result is. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, hospitality, d3, p30

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C feedback (Distractor): Not quite. A forecast gives a chance, not a promise about the single case in front of you.

D feedback (Distractor): Not quite. The percentage is about likelihood, not popularity or approval.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

probability-097 | Level 4 | Answer B

Prompt. A screening tool connected to evening bus service for late-shift workers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong. choice	**B.** Take the signal seriously, but ask how often this kind of tool is wrong. correct
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, transportation, d4, p55

A feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-098 | Level 4 | Answer A

Prompt. A screening tool connected to classroom phone lockers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm. correct	**B.** Ignore the signal because some signals are wrong. choice
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d4, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-099 | Level 4 | Answer D

Prompt. A screening tool connected to medication reminder texts for older patients flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Ignore the signal because some signals are wrong. choice
C. Treat the signal as strong enough to act on without any follow-up check. choice	**D.** Use the signal as a reason to check further, not as proof that the problem is there. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, health, d4, p65

A feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-100 | Level 4 | Answer C

Prompt. A screening tool connected to a four-day workweek test for software engineers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Treat the signal as strong enough to act on without any follow-up check. choice
C. Check the base rate and false-alarm rate before treating the signal as strong evidence. correct	**D.** Ignore the signal because some signals are wrong. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, workplace, d4, p70

A feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

B feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

probability-101 | Level 4 | Answer B

Prompt. A screening tool connected to larger grocery unit-price labels flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** See the signal as evidence to investigate, while remembering that it is not certainty. correct
C. Ignore the signal because some signals are wrong. choice	**D.** Look only at the positive signal and ignore how common the problem is in the first place. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, retail, d4, p75

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

probability-102 | Level 4 | Answer A

Prompt. A screening tool connected to late fines on children's books flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong. correct	**B.** Look only at the positive signal and ignore how common the problem is in the first place. choice
C. Ignore the signal because some signals are wrong. choice	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, public services, d4, p80

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-103 | Level 4 | Answer D

Prompt. A screening tool connected to two-factor login for site administrators flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong. choice	**B.** Treat the signal as strong enough to act on without any follow-up check. choice
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Update cautiously because a positive signal can still turn out to be a false alarm. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

probability-119 | Level 4 | Answer D

Prompt. A screening tool connected to weekly call-center script coaching flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Look only at the positive signal and ignore how common the problem is in the first place. choice
C. Ignore the signal because some signals are wrong. choice	**D.** Use the signal as a reason to check further, not as proof that the problem is there. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, customer support, d4, p85

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-120 | Level 4 | Answer C

Prompt. A screening tool connected to household water-leak alerts flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Ignore the signal because some signals are wrong. choice
C. Check the base rate and false-alarm rate before treating the signal as strong evidence. correct	**D.** Look only at the positive signal and ignore how common the problem is in the first place. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

probability-121 | Level 4 | Answer D

Prompt. A screening tool connected to body-camera activation reminders flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Ignore the signal because some signals are wrong. choice
C. Treat the signal as strong enough to act on without any follow-up check. choice	**D.** See the signal as evidence to investigate, while remembering that it is not certainty. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-122 | Level 4 | Answer B

Prompt. A screening tool connected to county mail-ballot tracking flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Take the signal seriously, but ask how often this kind of tool is wrong. correct
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Ignore the signal because some signals are wrong. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-127 | Level 4 | Answer A

Prompt. A screening tool connected to clearer farmers market price signs flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong. correct	**B.** Ignore the signal because some signals are wrong. choice
C. Treat the signal as strong enough to act on without any follow-up check. choice	**D.** Look only at the positive signal and ignore how common the problem is in the first place. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, local commerce, d4, p30

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

probability-128 | Level 4 | Answer B

Prompt. A screening tool connected to hotel quiet-hours text reminders flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Update cautiously because a positive signal can still turn out to be a false alarm. correct
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Ignore the signal because some signals are wrong. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, hospitality, d4, p40

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

probability-129 | Level 5 | Answer A

Prompt. A screening tool connected to evening bus service for late-shift workers gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm. correct	**B.** Ignore the signal because some signals are wrong. choice
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, transportation, d5, p60

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-130 | Level 5 | Answer B

Prompt. A screening tool connected to classroom phone lockers gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong. choice	**B.** Use the signal as a reason to check further, not as proof that the problem is there. correct
C. Treat the signal as strong enough to act on without any follow-up check. choice	**D.** Look only at the positive signal and ignore how common the problem is in the first place. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, education, d5, p65

A feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

probability-131 | Level 5 | Answer C

Prompt. A screening tool connected to medication reminder texts for older patients gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Ignore the signal because some signals are wrong. choice
C. Check the base rate and false-alarm rate before treating the signal as strong evidence. correct	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

probability-142 | Level 5 | Answer A

Prompt. A screening tool connected to youth soccer concussion checks gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. See the signal as evidence to investigate, while remembering that it is not certainty. correct	**B.** Treat the signal as strong enough to act on without any follow-up check. choice
C. Look only at the positive signal and ignore how common the problem is in the first place. choice	**D.** Ignore the signal because some signals are wrong. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

Tags: probability, sports, d5, p30

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

probability-143 | Level 5 | Answer D

Prompt. A screening tool connected to same-day donation receipts gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Look only at the positive signal and ignore how common the problem is in the first place. choice
C. Ignore the signal because some signals are wrong. choice	**D.** Take the signal seriously, but ask how often this kind of tool is wrong. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

probability-144 | Level 5 | Answer C

Prompt. A screening tool connected to warehouse ergonomic training gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Treat the signal as strong enough to act on without any follow-up check. choice
C. Update cautiously because a positive signal can still turn out to be a false alarm. correct	**D.** Ignore the signal because some signals are wrong. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

B feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

probability-145 | Level 5 | Answer B

Prompt. A screening tool connected to apartment-lobby compost bins gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place. choice	**B.** Use the signal as a reason to check further, not as proof that the problem is there. correct
C. Ignore the signal because some signals are wrong. choice	**D.** Treat the signal as strong enough to act on without any follow-up check. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

B feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

probability-146 | Level 5 | Answer A

Prompt. A screening tool connected to private-by-default app profiles gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Check the base rate and false-alarm rate before treating the signal as strong evidence. correct	**B.** Treat the signal as strong enough to act on without any follow-up check. choice
C. Ignore the signal because some signals are wrong. choice	**D.** Look only at the positive signal and ignore how common the problem is in the first place. choice

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A feedback (Correct): Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B feedback (Distractor): Not quite. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C feedback (Distractor): Not quite. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D feedback (Distractor): Not quite. Base rates matter. A signal means more when the problem is common than when it is rare.

probability-147 | Level 5 | Answer D

Prompt. A screening tool connected to same-day clinic appointment slots gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check. choice	**B.** Look only at the positive signal and ignore how common the problem is in the first place. choice
C. Ignore the signal because some signals are wrong. choice	**D.** See the signal as evidence to investigate, while remembering that it is not certainty. correct

Core explanation. Probability is about chance and uncertainty, not guarantees.

Process commentary. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.
