Skill 16

Update Beliefs Responsibly

How Should Belief Change?

160 Items	**1-5** Levels	**Change confidence by the right amount.** Objective

Essential question. How much should new evidence change confidence?

This PDF is designed for classroom use. It gives teachers a rigorous introduction to the skill, a repeatable solving routine, likely student confusions, a worked example, and the full XiXteen item set with choice-level feedback.

Generated from the current XiXteen corpus on 2026-10-29.

Skill 16

Update Beliefs Responsibly

How Should Belief Change?

Change confidence by the right amount. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	How much should new evidence change confidence?
Why it matters	Strong thinkers change confidence by the right amount. They neither ignore new evidence nor swing wildly from one result to certainty.
Conceptual core	Belief updating teaches proportion. Students should neither ignore evidence that points in a direction nor treat one small result as final proof. The skill joins direction and size: does the evidence support or weaken the claim, and is it strong enough to move confidence a little or a lot? This habit is central to intellectual humility.
Student method	Ask whether the evidence points toward or away from the claim, how strong the evidence is, and what uncertainty remains. Then move confidence a little or a lot accordingly.
Analogy	Belief updating is steering, not teleporting. New evidence should turn the wheel in proportion to its strength.
Assessment focus	A good answer names both the direction and size of the confidence change while preserving remaining uncertainty.

Teaching Sequence

1. State the prior uncertainty or starting belief.

2. Decide whether the evidence points toward or away from the claim.

3. Judge the evidence strength using sample, comparison, directness, and reliability.

4. Move confidence by an amount that fits the evidence.

Common Confusions To Watch For

1. Students may think changing confidence means fully changing sides.

2. Students may ignore weak evidence because it is not conclusive.

3. Students may overreact to one vivid case or small test.

Teacher Prompts

1. Which direction does the evidence point?

2. How strong is it?

3. What uncertainty remains after we update?

Worked Example

Scenario	You are unsure whether brighter lights reduce theft reports. A small matched test finds reports fell from 50 to 44 over the same period nearby streets stayed about the same.
Teacher think-aloud	The evidence points toward the lights helping, and the comparison makes it more useful. But it is still one small test, so confidence should increase somewhat, not jump to certainty.
Student takeaway	Responsible updating changes belief in proportion to evidence strength.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. You begin unsure whether brighter streetlights reduce theft reports. Study A is one resident saying a street feels safer. Study B assigns 40 similar streets at random to brighter or unchanged lighting, keeps patrol policy the same, and records the same theft measure before and after: reports fall more in the brighter-light group. No exact effect size or uncertainty estimate is supplied.

What To Do

1. For each study, say whether it should raise, lower, or leave your confidence roughly unchanged, and explain why.

2. Choose which should change confidence more, using the difference between personal impressions and a controlled comparison.

3. Name one missing detail you would seek before making a strong conclusion. Do not invent a precise percentage change in confidence.

Check before reading the answer. Have you updated more for the stronger relevant evidence while keeping uncertainty about the size and reliability of the effect?

Model Answer

Study A should change confidence about theft reports very little: feeling safer is a different outcome and one person's impression. Study B should raise confidence more because random assignment and consistent measurement provide a fairer comparison of the claimed outcome. I would request the size of the difference and its uncertainty before making a strong claim.

Why it is adequate. It ties the direction and strength of the update to evidence quality and acknowledges that the scenario cannot justify an exact confidence number.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

belief_update-001 | Level 1 | Answer B

Prompt. You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints fell by 22% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Raise confidence somewhat, while staying open to better evidence. correct
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, transportation, d1

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-002 | Level 1 | Answer C

Prompt. You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you see a random comparison using two similar groups. In the group that used the plan, classroom disruption reports fell by 31% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Raise confidence a lot, while still avoiding total certainty. correct	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, education, d1

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-003 | Level 1 | Answer D

Prompt. You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports rose by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Lower confidence somewhat, while staying open to better evidence. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, health, d1

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-004 | Level 1 | Answer A

Prompt. You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn that the test calendar starts on a Monday. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works. correct	**B.** Treat the side detail as strong evidence. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, workplace, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-005 | Level 1 | Answer B

Prompt. You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints fell by 27% compared with the four weeks before the test. You also learn that a local consumer group ran a price-literacy campaign. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it. correct
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, retail, d1

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-006 | Level 1 | Answer C

Prompt. You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals rose by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Shift your confidence upward a bit, because the test helps but does not settle the question. correct	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, public services, d1

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-007 | Level 1 | Answer D

Prompt. You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you see a random comparison using two similar groups. In the group that used the plan, admin account takeovers fell by 44% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Treat the comparison as just a story. choice
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Become much more confident, but do not treat one comparison as perfect proof. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, technology, d1

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-008 | Level 1 | Answer A

Prompt. You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts rose by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small. correct	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Dismiss the negative result as background noise. choice	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, public safety, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-009 | Level 1 | Answer D

Prompt. You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn that the tutoring room has new chairs. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Treat the side detail as strong evidence. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Do not change confidence much, because the new detail is not evidence about the result. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, education, d1

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-010 | Level 1 | Answer A

Prompt. You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders fell by 16% compared with the four weeks before the test. You also learn that dessert prices increased at the same time. How should your confidence in that claim change?

A. Make only a slight upward update, since the result helps but the other change weakens the update. correct	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, nutrition, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-011 | Level 1 | Answer C

Prompt. You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees fell by 24% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Treat the test as strong proof. choice
C. Become somewhat more confident, while remembering that one small test is limited. correct	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, finance, d1

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-012 | Level 1 | Answer B

Prompt. You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you see a random comparison using two similar groups. In the group that used the plan, trail crowding complaints fell by 33% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Give the claim a strong boost because the comparison makes the evidence much better. correct
C. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, environment, d1

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-013 | Level 1 | Answer A

Prompt. You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits fell by 29% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat less confident, while remembering that one small test is limited. correct	**B.** Dismiss the negative result as background noise. choice
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, culture, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-014 | Level 1 | Answer D

Prompt. You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn that the concussion checklist is printed on yellow paper. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Treat the side detail as strong evidence. choice	**D.** Leave confidence mostly where it was, since the detail does not check the claim. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, sports, d1

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-015 | Level 1 | Answer C

Prompt. You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention rose by 14% compared with the four weeks before the test. You also learn that the nonprofit also launched a matching campaign. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice
C. Adjust upward a bit, while taking the competing explanation seriously. correct	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, nonprofit, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-016 | Level 1 | Answer B

Prompt. You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims fell by 20% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Treat the result as support for the claim, but keep looking for stronger evidence. correct
C. Treat the test as strong proof. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, workplace safety, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-017 | Level 1 | Answer A

Prompt. You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you see a random comparison using two similar groups. In the group that used the plan, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Make a sharp upward update, while leaving room for future evidence to matter. correct	**B.** Treat the comparison as just a story. choice
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, environment, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-018 | Level 1 | Answer D

Prompt. You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles rose by 48% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Dismiss the negative result as background noise. choice	**D.** Treat the result as evidence against the claim, but not as final disproof. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, technology, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-019 | Level 1 | Answer C

Prompt. You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn that the appointment cards are white. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Treat the side detail as strong evidence. choice
C. Treat the detail as mostly irrelevant to whether the plan causes the result. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, health, d1

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-020 | Level 1 | Answer B

Prompt. You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time fell by 9% compared with the four weeks before the test. You also learn that the airline also reduced carry-on size limits. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Treat the result as some support, but keep the update small because of the other change. correct
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, travel, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-021 | Level 1 | Answer D

Prompt. You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests fell by 26% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Make a modest upward update because the result points the right way but is still small. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, housing, d1

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-022 | Level 1 | Answer A

Prompt. You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you see a random comparison using two similar groups. In the group that used the plan, fruit purchases rose by 23% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the claim as much more likely, though not guaranteed in every setting. correct	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Treat the comparison as just a story. choice	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, food, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

belief_update-023 | Level 1 | Answer B

Prompt. You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates rose by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Decrease confidence modestly because the result points the wrong way but is still small. correct
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, customer support, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-024 | Level 1 | Answer C

Prompt. You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn that the water-leak alert screen includes a blue droplet icon. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Treat the side detail as strong evidence. choice
C. Avoid moving confidence much because the detail does not bear on the claim. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, utilities, d1

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-025 | Level 1 | Answer D

Prompt. You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports fell by 35% compared with the four weeks before the test. You also learn that the department also updated supervisor reviews. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Become only a little more confident because the helpful result has another possible cause. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, governance, d1

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-026 | Level 1 | Answer A

Prompt. You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status fell by 42% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence. correct	**B.** Treat the test as strong proof. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, election administration, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-027 | Level 1 | Answer B

Prompt. You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you see a random comparison using two similar groups. In the group that used the plan, vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Raise confidence a lot, while still avoiding total certainty. correct
C. Treat the comparison as just a story. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, learning, d1

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-028 | Level 1 | Answer C

Prompt. You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations rose by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Lower confidence somewhat, while staying open to better evidence. correct	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, fitness, d1

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-029 | Level 1 | Answer D

Prompt. You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn that the feedback dashboard uses star ratings. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Treat the side detail as strong evidence. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Keep confidence about the same, because that detail does not test whether the plan works. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, insurance, d1

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-030 | Level 1 | Answer A

Prompt. You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings rose by 7% compared with the four weeks before the test. You also learn that the newsroom also hired a public editor. How should your confidence in that claim change?

A. Nudge confidence upward only a little, because the result helps but another change could explain it. correct	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, media, d1

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-031 | Level 1 | Answer C

Prompt. You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes fell by 28% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Treat the test as strong proof. choice
C. Shift your confidence upward a bit, because the test helps but does not settle the question. correct	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, local commerce, d1

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-032 | Level 1 | Answer B

Prompt. You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you see a random comparison using two similar groups. In the group that used the plan, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Become much more confident, but do not treat one comparison as perfect proof. correct
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, hospitality, d1

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

belief_update-033 | Level 2 | Answer D

Prompt. You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you see a random comparison using two similar groups. In the group that used the plan, late-shift commute complaints fell by 22% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Treat the comparison as just a story. choice
C. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**D.** Become much more confident, but do not treat one comparison as perfect proof. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, transportation, d2

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-034 | Level 2 | Answer C

Prompt. You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports rose by 31% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Shift your confidence downward a bit, because the test counts against the claim but is small. correct	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, education, d2

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-035 | Level 2 | Answer B

Prompt. You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn that the text messages use a green pill icon. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Do not change confidence much, because the new detail is not evidence about the result. correct
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, health, d2

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-036 | Level 2 | Answer A

Prompt. You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations fell by 15% compared with the four weeks before the test. You also learn that the company also raised salaries that quarter. How should your confidence in that claim change?

A. Make only a slight upward update, since the result helps but the other change weakens the update. correct	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, workplace, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-037 | Level 2 | Answer D

Prompt. You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints fell by 27% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Shift your confidence upward a bit, because the test helps but does not settle the question. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, retail, d2

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-038 | Level 2 | Answer C

Prompt. You are unsure whether waiving late fines for children's books would increase library card renewals. Then you see a random comparison using two similar groups. In the group that used the plan, library card renewals rose by 19% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Treat the comparison as just a story. choice
C. Give the claim a strong boost because the comparison makes the evidence much better. correct	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, public services, d2

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

belief_update-039 | Level 2 | Answer B

Prompt. You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers rose by 44% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Become somewhat less confident, while remembering that one small test is limited. correct
C. Dismiss the negative result as background noise. choice	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, technology, d2

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-040 | Level 2 | Answer A

Prompt. You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn that the new light poles are made of aluminum. How should your confidence in that claim change?

A. Leave confidence mostly where it was, since the detail does not check the claim. correct	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, public safety, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-041 | Level 2 | Answer B

Prompt. You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates rose by 11% compared with the four weeks before the test. You also learn that the final exam was also shortened. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Adjust upward a bit, while taking the competing explanation seriously. correct
C. Treat the possible other cause as settling the issue. choice	**D.** Ignore the result completely because another change happened too, even though the result still points the right way. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, education, d2

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-042 | Level 2 | Answer A

Prompt. You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders fell by 16% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat more confident, while remembering that one small test is limited. correct	**B.** Treat the test as strong proof. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, nutrition, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-043 | Level 2 | Answer C

Prompt. You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you see a random comparison using two similar groups. In the group that used the plan, overdraft fees fell by 24% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Make a sharp upward update, while leaving room for future evidence to matter. correct	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, finance, d2

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-044 | Level 2 | Answer D

Prompt. You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints rose by 33% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Treat the result as evidence against the claim, but not as final disproof. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, environment, d2

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-045 | Level 2 | Answer A

Prompt. You are unsure whether offering free admission on Fridays would increase family visits. Then you learn that the Friday tickets are scanned at the east door. How should your confidence in that claim change?

A. Treat the detail as mostly irrelevant to whether the plan causes the result. correct	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, culture, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-046 | Level 2 | Answer B

Prompt. You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries fell by 21% compared with the four weeks before the test. You also learn that the league also shortened the season. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Treat the result as some support, but keep the update small because of the other change. correct
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Ignore the result completely because another change happened too, even though the result still points the right way. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, sports, d2

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-047 | Level 2 | Answer C

Prompt. You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention rose by 14% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Keep confidence exactly the same, because one small test can never matter. choice
C. Treat the result as support for the claim, but keep looking for stronger evidence. correct	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, nonprofit, d2

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-048 | Level 2 | Answer D

Prompt. You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you see a random comparison using two similar groups. In the group that used the plan, back-injury claims fell by 20% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Treat the comparison as just a story. choice	**D.** Treat the claim as much more likely, though not guaranteed in every setting. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, workplace safety, d2

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-049 | Level 2 | Answer A

Prompt. You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings rose by 17% compared with the four weeks before the test. How should your confidence in that claim change?

A. Decrease confidence modestly because the result points the wrong way but is still small. correct	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Dismiss the negative result as background noise. choice	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, environment, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-050 | Level 2 | Answer B

Prompt. You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn that the privacy screen uses a shield icon. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Avoid moving confidence much because the detail does not bear on the claim. correct
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, technology, d2

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-051 | Level 2 | Answer C

Prompt. You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates fell by 13% compared with the four weeks before the test. You also learn that the clinic also began reminder calls. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Become only a little more confident because the helpful result has another possible cause. correct	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, health, d2

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-052 | Level 2 | Answer D

Prompt. You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time fell by 9% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Keep confidence exactly the same, because one small test can never matter. choice
C. Treat the test as strong proof. choice	**D.** Make a modest upward update because the result points the right way but is still small. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, travel, d2

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-053 | Level 2 | Answer B

Prompt. You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you see a random comparison using two similar groups. In the group that used the plan, unresolved repair requests fell by 26% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Raise confidence a lot, while still avoiding total certainty. correct
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, housing, d2

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-054 | Level 2 | Answer A

Prompt. You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases fell by 23% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence somewhat, while staying open to better evidence. correct	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Dismiss the negative result as background noise. choice	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, food, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-055 | Level 2 | Answer D

Prompt. You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn that the coaching slides use blue headers. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Treat the side detail as strong evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Keep confidence about the same, because that detail does not test whether the plan works. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, customer support, d2

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-056 | Level 2 | Answer C

Prompt. You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use fell by 10% compared with the four weeks before the test. You also learn that a rainy season began during the study. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Nudge confidence upward only a little, because the result helps but another change could explain it. correct	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, utilities, d2

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-057 | Level 2 | Answer B

Prompt. You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports fell by 35% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Raise confidence somewhat, while staying open to better evidence. correct
C. Treat the test as strong proof. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, governance, d2

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-058 | Level 2 | Answer A

Prompt. You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you see a random comparison using two similar groups. In the group that used the plan, phone calls asking ballot status fell by 42% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Become much more confident, but do not treat one comparison as perfect proof. correct	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Treat the comparison as just a story. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, election administration, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-059 | Level 2 | Answer D

Prompt. You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores fell by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Dismiss the negative result as background noise. choice
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Shift your confidence downward a bit, because the test counts against the claim but is small. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, learning, d2

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-060 | Level 2 | Answer C

Prompt. You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn that the orientation mats are black. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Do not change confidence much, because the new detail is not evidence about the result. correct	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, fitness, d2

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-061 | Level 2 | Answer B

Prompt. You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes fell by 8% compared with the four weeks before the test. You also learn that fuel prices changed driving patterns that month. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Make only a slight upward update, since the result helps but the other change weakens the update. correct
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, insurance, d2

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-062 | Level 2 | Answer A

Prompt. You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings rose by 7% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question. correct	**B.** Keep confidence exactly the same, because one small test can never matter. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, media, d2

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-063 | Level 2 | Answer C

Prompt. You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you see a random comparison using two similar groups. In the group that used the plan, price disputes fell by 28% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Give the claim a strong boost because the comparison makes the evidence much better. correct	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, local commerce, d2

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-064 | Level 2 | Answer D

Prompt. You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms rose by 30% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Dismiss the negative result as background noise. choice	**D.** Become somewhat less confident, while remembering that one small test is limited. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, hospitality, d2

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

belief_update-065 | Level 3 | Answer B

Prompt. You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints rose by 22% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Become somewhat less confident, while remembering that one small test is limited. correct
C. Dismiss the negative result as background noise. choice	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, transportation, d3

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-066 | Level 3 | Answer C

Prompt. You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn that the lockers are installed near the gym. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Leave confidence mostly where it was, since the detail does not check the claim. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, education, d3

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-067 | Level 3 | Answer D

Prompt. You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports fell by 18% compared with the four weeks before the test. You also learn that pharmacists also began follow-up calls. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice
C. Treat the possible other cause as settling the issue. choice	**D.** Adjust upward a bit, while taking the competing explanation seriously. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, health, d3

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-068 | Level 3 | Answer A

Prompt. You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations fell by 15% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat more confident, while remembering that one small test is limited. correct	**B.** Treat the test as strong proof. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, workplace, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-069 | Level 3 | Answer B

Prompt. You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you see a random comparison using two similar groups. In the group that used the plan, shopper overpayment complaints fell by 27% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Give the claim a strong boost because the comparison makes the evidence much better. correct
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, retail, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-070 | Level 3 | Answer C

Prompt. You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals fell by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Treat the result as evidence against the claim, but not as final disproof. correct	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, public services, d3

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-071 | Level 3 | Answer D

Prompt. You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn that the login button changed from green to blue. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, technology, d3

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-072 | Level 3 | Answer A

Prompt. You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts fell by 12% compared with the four weeks before the test. You also learn that police patrols increased during the same period. How should your confidence in that claim change?

A. Treat the result as some support, but keep the update small because of the other change. correct	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Treat the possible other cause as settling the issue. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, public safety, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-073 | Level 3 | Answer B

Prompt. You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates rose by 11% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Treat the result as support for the claim, but keep looking for stronger evidence. correct
C. Treat the test as strong proof. choice	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, education, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-074 | Level 3 | Answer C

Prompt. You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you see a random comparison using two similar groups. In the group that used the plan, dessert orders fell by 16% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Make a sharp upward update, while leaving room for future evidence to matter. correct	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, nutrition, d3

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-075 | Level 3 | Answer C

Prompt. You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees rose by 24% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Decrease confidence modestly because the result points the wrong way but is still small. correct	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, finance, d3

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-076 | Level 3 | Answer B

Prompt. You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn that the digital passes include a small trail map. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Avoid moving confidence much because the detail does not bear on the claim. correct
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, environment, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-077 | Level 3 | Answer A

Prompt. You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits rose by 29% compared with the four weeks before the test. You also learn that a new children's exhibit opened the same week. How should your confidence in that claim change?

A. Become only a little more confident because the helpful result has another possible cause. correct	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, culture, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-078 | Level 3 | Answer D

Prompt. You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries fell by 21% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Treat the test as strong proof. choice	**D.** Make a modest upward update because the result points the right way but is still small. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, sports, d3

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-079 | Level 3 | Answer C

Prompt. You are unsure whether sending donation receipts within one day would increase donor retention. Then you see a random comparison using two similar groups. In the group that used the plan, donor retention rose by 14% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Treat the claim as much more likely, though not guaranteed in every setting. correct	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, nonprofit, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-080 | Level 3 | Answer B

Prompt. You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims rose by 20% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Lower confidence somewhat, while staying open to better evidence. correct
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, workplace safety, d3

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-081 | Level 3 | Answer A

Prompt. You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn that the lobby compost bins have foot pedals. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works. correct	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, environment, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-082 | Level 3 | Answer D

Prompt. You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles fell by 48% compared with the four weeks before the test. You also learn that the app also deleted inactive accounts. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Nudge confidence upward only a little, because the result helps but another change could explain it. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, technology, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-083 | Level 3 | Answer A

Prompt. You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates fell by 13% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence. correct	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, health, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-084 | Level 3 | Answer D

Prompt. You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you see a random comparison using two similar groups. In the group that used the plan, average boarding time fell by 9% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Treat the comparison as just a story. choice	**D.** Raise confidence a lot, while still avoiding total certainty. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, travel, d3

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-085 | Level 3 | Answer B

Prompt. You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests rose by 26% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Shift your confidence downward a bit, because the test counts against the claim but is small. correct
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, housing, d3

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-086 | Level 3 | Answer C

Prompt. You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn that the fruit bowls are ceramic. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Treat the side detail as strong evidence. choice
C. Do not change confidence much, because the new detail is not evidence about the result. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, food, d3

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-087 | Level 3 | Answer D

Prompt. You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates fell by 18% compared with the four weeks before the test. You also learn that the call queue was also shortened. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Treat the possible other cause as settling the issue. choice	**D.** Make only a slight upward update, since the result helps but the other change weakens the update. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, customer support, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-088 | Level 3 | Answer A

Prompt. You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use fell by 10% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question. correct	**B.** Keep confidence exactly the same, because one small test can never matter. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, utilities, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-089 | Level 3 | Answer B

Prompt. You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you see a random comparison using two similar groups. In the group that used the plan, missing-camera-footage reports fell by 35% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Become much more confident, but do not treat one comparison as perfect proof. correct
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, governance, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-090 | Level 3 | Answer C

Prompt. You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status rose by 42% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Become somewhat less confident, while remembering that one small test is limited. correct	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, election administration, d3

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-091 | Level 3 | Answer D

Prompt. You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn that the review prompts use a bell icon. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Leave confidence mostly where it was, since the detail does not check the claim. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, learning, d3

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-092 | Level 3 | Answer A

Prompt. You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations fell by 19% compared with the four weeks before the test. You also learn that the gym also discounted annual plans. How should your confidence in that claim change?

A. Adjust upward a bit, while taking the competing explanation seriously. correct	**B.** Treat the possible other cause as settling the issue. choice
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, fitness, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-093 | Level 3 | Answer D

Prompt. You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes fell by 8% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Become somewhat more confident, while remembering that one small test is limited. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, insurance, d3

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-094 | Level 3 | Answer A

Prompt. You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you see a random comparison using two similar groups. In the group that used the plan, reader trust ratings rose by 7% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better. correct	**B.** Treat the comparison as just a story. choice
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, media, d3

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-095 | Level 3 | Answer C

Prompt. You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes rose by 28% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Treat the result as evidence against the claim, but not as final disproof. correct	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, local commerce, d3

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-096 | Level 3 | Answer B

Prompt. You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn that the quiet-hours text reminder uses a small moon icon. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Treat the detail as mostly irrelevant to whether the plan causes the result. correct
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, hospitality, d3

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

belief_update-097 | Level 4 | Answer D

Prompt. You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn that the new buses were repainted blue. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Treat the side detail as strong evidence. choice	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, transportation, d4

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-098 | Level 4 | Answer C

Prompt. You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports fell by 31% compared with the four weeks before the test. You also learn that a new hall monitor schedule began at the same time. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Treat the result as some support, but keep the update small because of the other change. correct	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, education, d4

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-099 | Level 4 | Answer B

Prompt. You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports fell by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Treat the result as support for the claim, but keep looking for stronger evidence. correct
C. Treat the test as strong proof. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, health, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-100 | Level 4 | Answer A

Prompt. You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you see a random comparison using two similar groups. In the group that used the plan, staff resignations fell by 15% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Make a sharp upward update, while leaving room for future evidence to matter. correct	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Treat the comparison as just a story. choice	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, workplace, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

belief_update-101 | Level 4 | Answer D

Prompt. You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints rose by 27% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Dismiss the negative result as background noise. choice	**D.** Treat the result as evidence against the claim, but not as final disproof. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, retail, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-102 | Level 4 | Answer C

Prompt. You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn that the children's-book checkout desk moved six feet. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Avoid moving confidence much because the detail does not bear on the claim. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, public services, d4

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-103 | Level 4 | Answer B

Prompt. You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers fell by 44% compared with the four weeks before the test. You also learn that some high-risk admin accounts were removed earlier. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Become only a little more confident because the helpful result has another possible cause. correct
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, technology, d4

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-104 | Level 4 | Answer A

Prompt. You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts fell by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Make a modest upward update because the result points the right way but is still small. correct	**B.** Treat the test as strong proof. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, public safety, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-105 | Level 4 | Answer D

Prompt. You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you see a random comparison using two similar groups. In the group that used the plan, course pass rates rose by 11% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Treat the comparison as just a story. choice	**D.** Treat the claim as much more likely, though not guaranteed in every setting. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, education, d4

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-106 | Level 4 | Answer C

Prompt. You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders rose by 16% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Decrease confidence modestly because the result points the wrong way but is still small. correct	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, nutrition, d4

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-107 | Level 4 | Answer A

Prompt. You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn that the warning texts arrive from a short code. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works. correct	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Treat the side detail as strong evidence. choice	**D.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, finance, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

belief_update-108 | Level 4 | Answer B

Prompt. You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints fell by 33% compared with the four weeks before the test. You also learn that a nearby trail reopened that month. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it. correct
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, environment, d4

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-109 | Level 4 | Answer C

Prompt. You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits rose by 29% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Treat the test as strong proof. choice
C. Raise confidence somewhat, while staying open to better evidence. correct	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, culture, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-110 | Level 4 | Answer D

Prompt. You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you see a random comparison using two similar groups. In the group that used the plan, repeat head injuries fell by 21% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Raise confidence a lot, while still avoiding total certainty. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, sports, d4

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-111 | Level 4 | Answer C

Prompt. You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention fell by 14% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Lower confidence somewhat, while staying open to better evidence. correct	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, nonprofit, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-112 | Level 4 | Answer A

Prompt. You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn that the training room has a ceiling-mounted projector. How should your confidence in that claim change?

A. Do not change confidence much, because the new detail is not evidence about the result. correct	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, workplace safety, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-113 | Level 4 | Answer C

Prompt. You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings fell by 17% compared with the four weeks before the test. You also learn that trash pickup schedules also changed. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Make only a slight upward update, since the result helps but the other change weakens the update. correct	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, environment, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-114 | Level 4 | Answer A

Prompt. You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles fell by 48% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question. correct	**B.** Treat the test as strong proof. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Lower confidence because the test is small, even though its result points the right way. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, technology, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-115 | Level 4 | Answer C

Prompt. You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you see a random comparison using two similar groups. In the group that used the plan, patient no-show rates fell by 13% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Treat the comparison as just a story. choice
C. Become much more confident, but do not treat one comparison as perfect proof. correct	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, health, d4

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

belief_update-116 | Level 4 | Answer A

Prompt. You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time rose by 9% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small. correct	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, travel, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-117 | Level 4 | Answer B

Prompt. You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn that the repair portal uses a house logo. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Leave confidence mostly where it was, since the detail does not check the claim. correct
C. Treat the side detail as strong evidence. choice	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, housing, d4

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-118 | Level 4 | Answer D

Prompt. You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases rose by 23% compared with the four weeks before the test. You also learn that a fruit discount started that week. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Ignore the result completely because another change happened too, even though the result still points the right way. choice
C. Treat the possible other cause as settling the issue. choice	**D.** Adjust upward a bit, while taking the competing explanation seriously. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, food, d4

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-119 | Level 4 | Answer B

Prompt. You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates fell by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Become somewhat more confident, while remembering that one small test is limited. correct
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, customer support, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-120 | Level 4 | Answer A

Prompt. You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you see a random comparison using two similar groups. In the group that used the plan, average household water use fell by 10% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better. correct	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Treat the comparison as just a story. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, utilities, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-121 | Level 4 | Answer B

Prompt. You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports rose by 35% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Become somewhat less confident, while remembering that one small test is limited. correct
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, governance, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-122 | Level 4 | Answer D

Prompt. You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn that the ballot-tracking page uses county colors. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Treat the side detail as strong evidence. choice
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, election administration, d4

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

C feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-123 | Level 4 | Answer B

Prompt. You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. You also learn that the app also changed the quiz format. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Treat the result as some support, but keep the update small because of the other change. correct
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Ignore the result completely because another change happened too, even though the result still points the right way. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, learning, d4

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-124 | Level 4 | Answer D

Prompt. You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations fell by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Treat the test as strong proof. choice	**D.** Treat the result as support for the claim, but keep looking for stronger evidence. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, fitness, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-125 | Level 4 | Answer B

Prompt. You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you see a random comparison using two similar groups. In the group that used the plan, reported minor crashes fell by 8% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Make a sharp upward update, while leaving room for future evidence to matter. correct
C. Treat the comparison as just a story. choice	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, insurance, d4

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

belief_update-126 | Level 4 | Answer A

Prompt. You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings fell by 7% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the result as evidence against the claim, but not as final disproof. correct	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, media, d4

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-127 | Level 4 | Answer C

Prompt. You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn that the stall price signs are laminated. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Avoid moving confidence much because the detail does not bear on the claim. correct	**D.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, local commerce, d4

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

belief_update-128 | Level 4 | Answer D

Prompt. You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms fell by 30% compared with the four weeks before the test. You also learn that the hotel also changed room assignments. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Become only a little more confident because the helpful result has another possible cause. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, hospitality, d4

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

belief_update-129 | Level 5 | Answer A

Prompt. You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints fell by 22% compared with the four weeks before the test. You also learn that a large employer started a private shuttle the same month. How should your confidence in that claim change?

A. Become only a little more confident because the helpful result has another possible cause. correct	**B.** Treat the possible other cause as settling the issue. choice
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Ignore the result completely because another change happened too, even though the result still points the right way. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, transportation, d5

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-130 | Level 5 | Answer B

Prompt. You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports fell by 31% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Make a modest upward update because the result points the right way but is still small. correct
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, education, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-131 | Level 5 | Answer C

Prompt. You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you see a random comparison using two similar groups. In the group that used the plan, missed-dose reports fell by 18% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Treat the claim as much more likely, though not guaranteed in every setting. correct	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, health, d5

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-132 | Level 5 | Answer D

Prompt. You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations rose by 15% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Dismiss the negative result as background noise. choice
C. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**D.** Decrease confidence modestly because the result points the wrong way but is still small. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, workplace, d5

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-133 | Level 5 | Answer A

Prompt. You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn that the shelf labels use bold black numbers. How should your confidence in that claim change?

A. Avoid moving confidence much because the detail does not bear on the claim. correct	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, retail, d5

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-134 | Level 5 | Answer B

Prompt. You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals rose by 19% compared with the four weeks before the test. You also learn that the library also opened on Sundays. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it. correct
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, public services, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-135 | Level 5 | Answer C

Prompt. You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers fell by 44% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Treat the test as strong proof. choice
C. Raise confidence somewhat, while staying open to better evidence. correct	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, technology, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-136 | Level 5 | Answer D

Prompt. You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you see a random comparison using two similar groups. In the group that used the plan, reported thefts fell by 12% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**D.** Raise confidence a lot, while still avoiding total certainty. correct

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, public safety, d5

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

belief_update-137 | Level 5 | Answer C

Prompt. You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates fell by 11% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Lower confidence somewhat, while staying open to better evidence. correct	**D.** Dismiss the negative result as background noise. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, education, d5

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-138 | Level 5 | Answer D

Prompt. You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn that the lunch menus are printed on thicker paper. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Treat the side detail as strong evidence. choice	**D.** Keep confidence about the same, because that detail does not test whether the plan works. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, nutrition, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-139 | Level 5 | Answer B

Prompt. You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees fell by 24% compared with the four weeks before the test. You also learn that the bank also changed its fee grace period. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Make only a slight upward update, since the result helps but the other change weakens the update. correct
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**D.** Treat the possible other cause as settling the issue. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, finance, d5

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

belief_update-140 | Level 5 | Answer D

Prompt. You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints fell by 33% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter. choice	**B.** Treat the test as strong proof. choice
C. Lower confidence because the test is small, even though its result points the right way. choice	**D.** Shift your confidence upward a bit, because the test helps but does not settle the question. correct

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, environment, d5

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

belief_update-141 | Level 5 | Answer B

Prompt. You are unsure whether offering free admission on Fridays would increase family visits. Then you see a random comparison using two similar groups. In the group that used the plan, family visits rose by 29% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**B.** Become much more confident, but do not treat one comparison as perfect proof. correct
C. Treat the comparison as just a story. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, culture, d5

A feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-142 | Level 5 | Answer A

Prompt. You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries rose by 21% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small. correct	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice
C. Dismiss the negative result as background noise. choice	**D.** Drop confidence all the way to zero, because one small test against a claim settles it. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, sports, d5

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-143 | Level 5 | Answer D

Prompt. You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn that the receipt email subject line changed. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice
C. Treat the side detail as strong evidence. choice	**D.** Do not change confidence much, because the new detail is not evidence about the result. correct

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, nonprofit, d5

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

belief_update-144 | Level 5 | Answer C

Prompt. You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims fell by 20% compared with the four weeks before the test. You also learn that new lifting equipment arrived that quarter. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice	**B.** Treat the possible other cause as settling the issue. choice
C. Adjust upward a bit, while taking the competing explanation seriously. correct	**D.** Ignore the result completely because another change happened too, even though the result still points the right way. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, workplace safety, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-145 | Level 5 | Answer B

Prompt. You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings fell by 17% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Become somewhat more confident, while remembering that one small test is limited. correct
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, environment, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-146 | Level 5 | Answer A

Prompt. You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you see a random comparison using two similar groups. In the group that used the plan, publicly visible profiles fell by 48% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better. correct	**B.** Treat the comparison as just a story. choice
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, technology, d5

A feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-147 | Level 5 | Answer D

Prompt. You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates rose by 13% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**B.** Drop confidence all the way to zero, because one small test against a claim settles it. choice
C. Dismiss the negative result as background noise. choice	**D.** Become somewhat less confident, while remembering that one small test is limited. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, health, d5

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-148 | Level 5 | Answer B

Prompt. You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn that the gate signs are backlit. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice	**B.** Leave confidence mostly where it was, since the detail does not check the claim. correct
C. Treat the side detail as strong evidence. choice	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, travel, d5

A feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

B feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-149 | Level 5 | Answer A

Prompt. You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests fell by 26% compared with the four weeks before the test. You also learn that the landlord hired two additional repair technicians. How should your confidence in that claim change?

A. Treat the result as some support, but keep the update small because of the other change. correct	**B.** Treat the possible other cause as settling the issue. choice
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, mixed-support, housing, d5

A feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-150 | Level 5 | Answer C

Prompt. You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases rose by 23% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way. choice	**B.** Treat the test as strong proof. choice
C. Treat the result as support for the claim, but keep looking for stronger evidence. correct	**D.** Keep confidence exactly the same, because one small test can never matter. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-support, food, d5

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-151 | Level 5 | Answer C

Prompt. You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you see a random comparison using two similar groups. In the group that used the plan, customer complaint rates fell by 18% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story. choice	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize. choice
C. Make a sharp upward update, while leaving room for future evidence to matter. correct	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, strong-support, customer support, d5

A feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-152 | Level 5 | Answer D

Prompt. You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use rose by 10% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Dismiss the negative result as background noise. choice
C. Keep confidence exactly the same, because a small negative test is never worth noticing. choice	**D.** Treat the result as evidence against the claim, but not as final disproof. correct

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, small-opposition, utilities, d5

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

belief_update-153 | Level 5 | Answer C

Prompt. You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn that the reminder tone is two beeps. How should your confidence in that claim change?

A. Treat the side detail as strong evidence. choice	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Treat the detail as mostly irrelevant to whether the plan causes the result. correct	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

Tags: belief_update, belief-update, irrelevant-detail, governance, d5

A feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-154 | Level 5 | Answer D

Prompt. You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status fell by 42% compared with the four weeks before the test. You also learn that the office also expanded its phone staff. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice
C. Treat the possible other cause as settling the issue. choice	**D.** Become only a little more confident because the helpful result has another possible cause. correct

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

belief_update-155 | Level 5 | Answer A

Prompt. You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Make a modest upward update because the result points the right way but is still small. correct	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

belief_update-156 | Level 5 | Answer B

Prompt. You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you see a random comparison using two similar groups. In the group that used the plan, new-member cancellations fell by 19% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it. choice	**B.** Treat the claim as much more likely, though not guaranteed in every setting. correct
C. Keep confidence unchanged because comparison groups make the result harder to summarize. choice	**D.** Treat the comparison as just a story. choice

Core explanation. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

B feedback (Correct): Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C feedback (Distractor): Not quite. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

belief_update-157 | Level 5 | Answer C

Prompt. You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes rose by 8% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it. choice	**B.** Dismiss the negative result as background noise. choice
C. Decrease confidence modestly because the result points the wrong way but is still small. correct	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing. choice

Core explanation. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Distractor): Not quite. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B feedback (Distractor): Not quite. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C feedback (Correct): Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

belief_update-158 | Level 5 | Answer A

Prompt. You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn that the correction box has a gray border. How should your confidence in that claim change?

A. Avoid moving confidence much because the detail does not bear on the claim. correct	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence. choice
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result. choice	**D.** Treat the side detail as strong evidence. choice

Core explanation. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Correct): Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B feedback (Distractor): Not quite. Confidence should move because of relevant evidence, not just because a new detail appeared.

C feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

D feedback (Distractor): Not quite. The detail does not test the claim, so it should not move confidence much.

belief_update-159 | Level 5 | Answer B

Prompt. You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes fell by 28% compared with the four weeks before the test. You also learn that the market also added a weekend help desk. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue. choice	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it. correct
C. Ignore the result completely because another change happened too, even though the result still points the right way. choice	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved. choice

Core explanation. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A feedback (Distractor): Not quite. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B feedback (Correct): Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C feedback (Distractor): Not quite. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D feedback (Distractor): Not quite. This moves confidence in the wrong direction for evidence that supports the claim.

belief_update-160 | Level 5 | Answer A

Prompt. You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms fell by 30% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence. correct	**B.** Lower confidence because the test is small, even though its result points the right way. choice
C. Keep confidence exactly the same, because one small test can never matter. choice	**D.** Treat the test as strong proof. choice

Core explanation. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Process commentary. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.
