Skill 06

Evaluate Evidence Quality

How Good Is the Evidence?

160 Items	**1-5** Levels	**Pick the strongest evidence from the details given.** Objective

Essential question. How strong is the evidence for this claim?

This PDF is designed for classroom use. It gives teachers a rigorous introduction to the skill, a repeatable solving routine, likely student confusions, a worked example, and the full XiXteen item set with choice-level feedback.

Generated from the current XiXteen corpus on 2026-10-29.

Skill 06

Evaluate Evidence Quality

How Good Is the Evidence?

Pick the strongest evidence from the details given. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	How strong is the evidence for this claim?
Why it matters	Not all evidence deserves the same weight. A story, a tiny survey, a biased report, and a well-designed comparison can all sound like evidence, but they do different amounts of work.
Conceptual core	Evidence quality depends on directness, comparison, measurement, sample size, and transparency. Students should learn that a piece of evidence can be relevant but still weak. A single anecdote, a vague report, or a tiny unrepresentative survey may point in a direction without carrying much weight. The skill is comparative: choose the option that would deserve the most confidence under the facts given.
Student method	Prefer evidence that measures the claimed result directly, uses a fair comparison, includes enough cases, and makes the method visible. Be cautious with anecdotes, impressions, and unsupported explanations.
Analogy	Evidence quality is like camera focus. A blurry photo may show something, but a clear, well-framed photo deserves more confidence.
Assessment focus	A good answer selects the option with better direct measurement, comparison, sample, and transparency.

Teaching Sequence

1. Ask whether the evidence measures the claimed outcome directly.

2. Look for a fair comparison or baseline.

3. Check whether the sample is large enough and similar enough to the target group.

4. Prefer visible methods over impressions and unexplained summaries.

Common Confusions To Watch For

1. Students may treat any number as strong evidence because it looks precise.

2. Students may overvalue a personal story when the claim is about a larger group.

3. Students may ignore whether the measurement matches the outcome in the claim.

Teacher Prompts

1. What was measured, and was it the right thing?

2. Compared with what?

3. How many cases, and were they like the group in the claim?

Worked Example

Scenario	A tutoring program claims it improves algebra pass rates. One happy student gives a testimonial, while a district report compares pass rates in similar classes with and without tutoring.
Teacher think-aloud	The testimonial is relevant but weak. The comparison report is stronger because it uses the right outcome, a comparison group, and more cases.
Student takeaway	Strong evidence is relevant evidence with better design.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A tutoring program claims it raises algebra pass rates. Report A quotes one volunteer saying tutoring helped. Report B follows 200 students randomly assigned to receive tutoring or usual support, uses the same exam, and reports all results: 70 of 100 tutored students pass, versus 55 of 100 others. Both reports are accurately described; use only these facts.

What To Do

1. Choose the stronger evidence for the program's claim.

2. Give three reasons using the number of students, the comparison groups, and the outcome measure.

3. State one limit: what would you still want to know before assuming the result applies to another school?

Check before reading the answer. Explain the evidence's method rather than treating a confident testimonial or a large number alone as decisive.

Model Answer

Report B is stronger: it includes 200 students rather than one selected volunteer, random assignment supplies a fairer comparison, and a common exam measures the stated outcome. I would check whether another school's students and tutoring program are similar before transferring the conclusion.

Why it is adequate. It connects three stated design features to the claim and keeps a local result separate from a universal promise.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

Riley wants to know whether the proposal to extend evening bus service until midnight actually helps late-shift workers by reducing late-shift commute complaints. Which evidence would be strongest?

A. A brochure explains how extending evening bus service until midnight would work but does not measure late-shift commute complaints or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A large, fair study measured late-shift commute complaints before and after the change.	**D.** A report measured late-shift commute complaints after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 2

Level 1

Maya wants to know whether the proposal to require phone lockers during class actually helps ninth-grade students by reducing classroom disruption reports. Which evidence would be strongest?

A. A report measured classroom disruption reports after the change but did not say what it was before the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A brochure explains how requiring phone lockers during class would work but does not measure classroom disruption reports or compare groups.	**D.** A random test compared similar groups with and without the change, then measured classroom disruption reports.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 3

Level 1

Sam wants to know whether the proposal to send medication reminder texts before evening doses actually helps patients over 60 by reducing missed-dose reports. Which evidence would be strongest?

A. Independent researchers used the same method to measure missed-dose reports before and after the plan.	**B.** Sam's friend says the idea feels promising but gives no data about missed-dose reports.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured missed-dose reports after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 4

Level 1

Avery wants to know whether the proposal to test a Monday-through-Thursday workweek actually helps software engineers by reducing staff resignations. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Several similar settings tried the plan, and each one measured staff resignations the same way.
C. A brochure explains how testing a Monday-through-Thursday workweek would work but does not measure staff resignations or compare groups.	**D.** A report measured staff resignations after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 5

Level 1

Taylor wants to know whether the proposal to add larger unit-price labels on shelf tags actually helps weekly grocery shoppers by reducing shopper overpayment complaints. Which evidence would be strongest?

A. Taylor's friend says the idea feels promising but gives no data about shopper overpayment complaints.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. The study reported its sample size, comparison method, and results for shopper overpayment complaints.	**D.** A brochure explains how adding larger unit-price labels on shelf tags would work but does not measure shopper overpayment complaints or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 6

Level 1

Morgan wants to know whether the proposal to waive late fines for children's books actually helps families checking out children's books by increasing library card renewals. Which evidence would be strongest?

A. A brochure explains how waiving late fines for children's books would work but does not measure library card renewals or compare groups.	**B.** Morgan's friend says the idea feels promising but gives no data about library card renewals.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Many people were included, and researchers measured library card renewals before and after the plan.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 7

Level 1

Casey wants to know whether the proposal to require two-factor login for site administrators actually helps site administrators by reducing admin account takeovers. Which evidence would be strongest?

A. Similar groups were randomly assigned to use or not use the plan, then admin account takeovers was measured.	**B.** Casey's friend says the idea feels promising but gives no data about admin account takeovers.
C. A brochure explains how requiring two-factor login for site administrators would work but does not measure admin account takeovers or compare groups.	**D.** A report measured admin account takeovers after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 8

Level 1

Jordan wants to know whether the proposal to add brighter LED streetlights on Maple Street actually helps residents on Maple Street by reducing reported thefts. Which evidence would be strongest?

A. A report measured reported thefts after the change but did not say what it was before the plan.	**B.** A team not connected to the proposal measured reported thefts with the same method each time.
C. A brochure explains how adding brighter LED streetlights on Maple Street would work but does not measure reported thefts or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 9

Level 1

Riley wants to know whether the proposal to expand peer tutoring in statistics actually helps first-year statistics students by increasing course pass rates. Which evidence would be strongest?

A. The plan was tried in several similar places, with course pass rates measured consistently in each one.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Riley's friend says the idea feels promising but gives no data about course pass rates.	**D.** A brochure explains how expanding peer tutoring in statistics would work but does not measure course pass rates or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 10

Level 1

Maya wants to know whether the proposal to show calorie labels on printed lunch menus actually helps lunch customers by reducing dessert orders. Which evidence would be strongest?

A. A report measured dessert orders after the change but did not say what it was before the plan.	**B.** The report gave the sample size, comparison method, and measured result for dessert orders.
C. A brochure explains how showing calorie labels on printed lunch menus would work but does not measure dessert orders or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 11

Level 1

Sam wants to know whether the proposal to send overdraft warning texts before fees post actually helps checking-account customers by reducing overdraft fees. Which evidence would be strongest?

A. A report measured overdraft fees after the change but did not say what it was before the plan.	**B.** A fair before-and-after study used a large sample to track overdraft fees.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A brochure explains how sending overdraft warning texts before fees post would work but does not measure overdraft fees or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 12

Level 1

Avery wants to know whether the proposal to use timed-entry passes for weekend trail visits actually helps weekend trail hikers by reducing trail crowding complaints. Which evidence would be strongest?

A. Researchers randomly compared a plan group with a no-plan group and tracked trail crowding complaints.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Avery's friend says the idea feels promising but gives no data about trail crowding complaints.	**D.** A brochure explains how using timed-entry passes for weekend trail visits would work but does not measure trail crowding complaints or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 13

Level 1

Taylor wants to know whether the proposal to offer free admission on Fridays actually helps local families by increasing family visits. Which evidence would be strongest?

A. A brochure explains how offering free admission on Fridays would work but does not measure family visits or compare groups.	**B.** A report measured family visits after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Outside researchers checked family visits before and after the plan using a consistent method.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 14

Level 1

Morgan wants to know whether the proposal to add mandatory sideline concussion checks actually helps youth soccer players by reducing repeat head injuries. Which evidence would be strongest?

A. Morgan's friend says the idea feels promising but gives no data about repeat head injuries.	**B.** A report measured repeat head injuries after the change but did not say what it was before the plan.
C. Multiple similar settings tracked repeat head injuries using the same method after trying the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 15

Level 1

Casey wants to know whether the proposal to send donation receipts within one day actually helps first-time donors by increasing donor retention. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Researchers listed how many cases were studied, how they compared them, and what happened to donor retention.
C. Casey's friend says the idea feels promising but gives no data about donor retention.	**D.** A report measured donor retention after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 16

Level 1

Jordan wants to know whether the proposal to offer monthly lifting-safety and ergonomic training actually helps warehouse staff by reducing back-injury claims. Which evidence would be strongest?

A. Researchers used a large sample and checked back-injury claims both before and after the change.	**B.** A brochure explains how offering monthly lifting-safety and ergonomic training would work but does not measure back-injury claims or compare groups.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured back-injury claims after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 17

Level 1

Riley wants to know whether the proposal to place compost bins in apartment lobbies actually helps apartment residents by reducing landfill waste from participating buildings. Which evidence would be strongest?

A. Riley's friend says the idea feels promising but gives no data about landfill waste from participating buildings.	**B.** A report measured landfill waste from participating buildings after the change but did not say what it was before the plan.
C. A brochure explains how placing compost bins in apartment lobbies would work but does not measure landfill waste from participating buildings or compare groups.	**D.** The plan was tested against a similar no-plan group chosen by random assignment.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 18

Level 1

Maya wants to know whether the proposal to make new user profiles private by default actually helps new app users by reducing publicly visible profiles. Which evidence would be strongest?

A. A report measured publicly visible profiles after the change but did not say what it was before the plan.	**B.** A brochure explains how making new user profiles private by default would work but does not measure publicly visible profiles or compare groups.
C. The measurement was done by an independent team using the same rules before and after.	**D.** Maya's friend says the idea feels promising but gives no data about publicly visible profiles.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 19

Level 1

Sam wants to know whether the proposal to reserve same-day appointment slots actually helps primary-care patients by reducing patient no-show rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Sam's friend says the idea feels promising but gives no data about patient no-show rates.
C. A brochure explains how reserving same-day appointment slots would work but does not measure patient no-show rates or compare groups.	**D.** Results from several similar places were checked with the same measure of patient no-show rates.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 20

Level 1

Avery wants to know whether the proposal to board passengers by seat zone actually helps domestic flight passengers by reducing average boarding time. Which evidence would be strongest?

A. A brochure explains how boarding passengers by seat zone would work but does not measure average boarding time or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A study write-up included the sample size, method, and results for average boarding time.	**D.** Avery's friend says the idea feels promising but gives no data about average boarding time.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 21

Level 1

Taylor wants to know whether the proposal to launch an online apartment repair portal actually helps apartment tenants by reducing unresolved repair requests. Which evidence would be strongest?

A. The evidence covers many cases and measures unresolved repair requests on both sides of the change.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Taylor's friend says the idea feels promising but gives no data about unresolved repair requests.	**D.** A report measured unresolved repair requests after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 22

Level 1

Morgan wants to know whether the proposal to move fruit bowls to the front of the cafeteria line actually helps middle-school students by increasing fruit purchases. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A fair random comparison measured fruit purchases in both the plan group and the no-plan group.
C. A brochure explains how moving fruit bowls to the front of the cafeteria line would work but does not measure fruit purchases or compare groups.	**D.** Morgan's friend says the idea feels promising but gives no data about fruit purchases.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 23

Level 1

Casey wants to know whether the proposal to give support agents weekly script coaching actually helps support agents by reducing customer complaint rates. Which evidence would be strongest?

A. A report measured customer complaint rates after the change but did not say what it was before the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. People outside the project collected comparable before-and-after data on customer complaint rates.	**D.** Casey's friend says the idea feels promising but gives no data about customer complaint rates.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 24

Level 1

Jordan wants to know whether the proposal to send automatic household water-leak alerts actually helps local homeowners by reducing average household water use. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Jordan's friend says the idea feels promising but gives no data about average household water use.
C. A report measured average household water use after the change but did not say what it was before the plan.	**D.** Comparable sites each tried the plan and used the same method to track average household water use.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 25

Level 1

Riley wants to know whether the proposal to send body-camera activation reminders before patrol shifts actually helps patrol officers by reducing missing-camera-footage reports. Which evidence would be strongest?

A. The evidence states who was measured, how the comparison worked, and what changed in missing-camera-footage reports.	**B.** A brochure explains how sending body-camera activation reminders before patrol shifts would work but does not measure missing-camera-footage reports or compare groups.
C. Riley's friend says the idea feels promising but gives no data about missing-camera-footage reports.	**D.** A report measured missing-camera-footage reports after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 26

Level 1

Maya wants to know whether the proposal to offer online mail-ballot tracking actually helps mail voters by reducing phone calls asking ballot status. Which evidence would be strongest?

A. A brochure explains how offering online mail-ballot tracking would work but does not measure phone calls asking ballot status or compare groups.	**B.** A large, fair study measured phone calls asking ballot status before and after the change.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured phone calls asking ballot status after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 27

Level 1

Sam wants to know whether the proposal to send spaced-review prompts for language vocabulary actually helps language learners by increasing vocabulary retention quiz scores. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured vocabulary retention quiz scores after the change but did not say what it was before the plan.
C. Sam's friend says the idea feels promising but gives no data about vocabulary retention quiz scores.	**D.** A random test compared similar groups with and without the change, then measured vocabulary retention quiz scores.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 28

Level 1

Avery wants to know whether the proposal to offer a beginner gym orientation actually helps new gym members by reducing new-member cancellations. Which evidence would be strongest?

A. A report measured new-member cancellations after the change but did not say what it was before the plan.	**B.** Independent researchers used the same method to measure new-member cancellations before and after the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A brochure explains how offering a beginner gym orientation would work but does not measure new-member cancellations or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 29

Level 1

Taylor wants to know whether the proposal to send weekly safe-driving feedback actually helps auto-insurance policyholders by reducing reported minor crashes. Which evidence would be strongest?

A. Taylor's friend says the idea feels promising but gives no data about reported minor crashes.	**B.** A brochure explains how sending weekly safe-driving feedback would work but does not measure reported minor crashes or compare groups.
C. Several similar settings tried the plan, and each one measured reported minor crashes the same way.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 30

Level 1

Morgan wants to know whether the proposal to place corrections at the top of articles actually helps newsletter readers by increasing reader trust ratings. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Morgan's friend says the idea feels promising but gives no data about reader trust ratings.
C. A report measured reader trust ratings after the change but did not say what it was before the plan.	**D.** The study reported its sample size, comparison method, and results for reader trust ratings.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 31

Level 1

Casey wants to know whether the proposal to require clearer price signs at vendor stalls actually helps weekend farmers market shoppers by reducing price disputes. Which evidence would be strongest?

A. Many people were included, and researchers measured price disputes before and after the plan.	**B.** Casey's friend says the idea feels promising but gives no data about price disputes.
C. A report measured price disputes after the change but did not say what it was before the plan.	**D.** A brochure explains how requiring clearer price signs at vendor stalls would work but does not measure price disputes or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 32

Level 1

Jordan wants to know whether the proposal to send quiet-hours text reminders to hotel guests actually helps overnight hotel guests by reducing noise complaints from guest rooms. Which evidence would be strongest?

A. A report measured noise complaints from guest rooms after the change but did not say what it was before the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Similar groups were randomly assigned to use or not use the plan, then noise complaints from guest rooms was measured.	**D.** Jordan's friend says the idea feels promising but gives no data about noise complaints from guest rooms.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

Maya wants to know whether the proposal to extend evening bus service until midnight actually helps late-shift workers by reducing late-shift commute complaints. Which evidence would be strongest?

A. Maya's friend says the idea feels promising but gives no data about late-shift commute complaints.	**B.** Similar groups were randomly assigned to use or not use the plan, then late-shift commute complaints was measured.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A brochure explains how extending evening bus service until midnight would work but does not measure late-shift commute complaints or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 34

Level 2

Sam wants to know whether the proposal to require phone lockers during class actually helps ninth-grade students by reducing classroom disruption reports. Which evidence would be strongest?

A. A team not connected to the proposal measured classroom disruption reports with the same method each time.	**B.** A brochure explains how requiring phone lockers during class would work but does not measure classroom disruption reports or compare groups.
C. A report measured classroom disruption reports after the change but did not say what it was before the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 35

Level 2

Avery wants to know whether the proposal to send medication reminder texts before evening doses actually helps patients over 60 by reducing missed-dose reports. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how sending medication reminder texts before evening doses would work but does not measure missed-dose reports or compare groups.
C. A report measured missed-dose reports after the change but did not say what it was before the plan.	**D.** The plan was tried in several similar places, with missed-dose reports measured consistently in each one.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 36

Level 2

Taylor wants to know whether the proposal to test a Monday-through-Thursday workweek actually helps software engineers by reducing staff resignations. Which evidence would be strongest?

A. A report measured staff resignations after the change but did not say what it was before the plan.	**B.** A brochure explains how testing a Monday-through-Thursday workweek would work but does not measure staff resignations or compare groups.
C. The report gave the sample size, comparison method, and measured result for staff resignations.	**D.** Taylor's friend says the idea feels promising but gives no data about staff resignations.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 37

Level 2

Morgan wants to know whether the proposal to add larger unit-price labels on shelf tags actually helps weekly grocery shoppers by reducing shopper overpayment complaints. Which evidence would be strongest?

A. A report measured shopper overpayment complaints after the change but did not say what it was before the plan.	**B.** Many people were included, and researchers measured shopper overpayment complaints before and after the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Morgan's friend says the idea feels promising but gives no data about shopper overpayment complaints.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 38

Level 2

Casey wants to know whether the proposal to waive late fines for children's books actually helps families checking out children's books by increasing library card renewals. Which evidence would be strongest?

A. Researchers randomly compared a plan group with a no-plan group and tracked library card renewals.	**B.** A report measured library card renewals after the change but did not say what it was before the plan.
C. Casey's friend says the idea feels promising but gives no data about library card renewals.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 39

Level 2

Jordan wants to know whether the proposal to require two-factor login for site administrators actually helps site administrators by reducing admin account takeovers. Which evidence would be strongest?

A. A brochure explains how requiring two-factor login for site administrators would work but does not measure admin account takeovers or compare groups.	**B.** A report measured admin account takeovers after the change but did not say what it was before the plan.
C. Jordan's friend says the idea feels promising but gives no data about admin account takeovers.	**D.** Outside researchers checked admin account takeovers before and after the plan using a consistent method.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 40

Level 2

Riley wants to know whether the proposal to add brighter LED streetlights on Maple Street actually helps residents on Maple Street by reducing reported thefts. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured reported thefts after the change but did not say what it was before the plan.
C. Multiple similar settings tracked reported thefts using the same method after trying the plan.	**D.** A brochure explains how adding brighter LED streetlights on Maple Street would work but does not measure reported thefts or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 41

Level 2

Maya wants to know whether the proposal to expand peer tutoring in statistics actually helps first-year statistics students by increasing course pass rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Researchers listed how many cases were studied, how they compared them, and what happened to course pass rates.
C. A brochure explains how expanding peer tutoring in statistics would work but does not measure course pass rates or compare groups.	**D.** Maya's friend says the idea feels promising but gives no data about course pass rates.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 42

Level 2

Sam wants to know whether the proposal to show calorie labels on printed lunch menus actually helps lunch customers by reducing dessert orders. Which evidence would be strongest?

A. A fair before-and-after study used a large sample to track dessert orders.	**B.** Sam's friend says the idea feels promising but gives no data about dessert orders.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured dessert orders after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 43

Level 2

Avery wants to know whether the proposal to send overdraft warning texts before fees post actually helps checking-account customers by reducing overdraft fees. Which evidence would be strongest?

A. The plan was tested against a similar no-plan group chosen by random assignment.	**B.** A report measured overdraft fees after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Avery's friend says the idea feels promising but gives no data about overdraft fees.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 44

Level 2

Taylor wants to know whether the proposal to use timed-entry passes for weekend trail visits actually helps weekend trail hikers by reducing trail crowding complaints. Which evidence would be strongest?

A. A brochure explains how using timed-entry passes for weekend trail visits would work but does not measure trail crowding complaints or compare groups.	**B.** The measurement was done by an independent team using the same rules before and after.
C. Taylor's friend says the idea feels promising but gives no data about trail crowding complaints.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 45

Level 2

Morgan wants to know whether the proposal to offer free admission on Fridays actually helps local families by increasing family visits. Which evidence would be strongest?

A. Morgan's friend says the idea feels promising but gives no data about family visits.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Results from several similar places were checked with the same measure of family visits.	**D.** A brochure explains how offering free admission on Fridays would work but does not measure family visits or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 46

Level 2

Casey wants to know whether the proposal to add mandatory sideline concussion checks actually helps youth soccer players by reducing repeat head injuries. Which evidence would be strongest?

A. Casey's friend says the idea feels promising but gives no data about repeat head injuries.	**B.** A report measured repeat head injuries after the change but did not say what it was before the plan.
C. A brochure explains how adding mandatory sideline concussion checks would work but does not measure repeat head injuries or compare groups.	**D.** A study write-up included the sample size, method, and results for repeat head injuries.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 47

Level 2

Jordan wants to know whether the proposal to send donation receipts within one day actually helps first-time donors by increasing donor retention. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Jordan's friend says the idea feels promising but gives no data about donor retention.
C. Researchers used a large sample and checked donor retention both before and after the change.	**D.** A brochure explains how sending donation receipts within one day would work but does not measure donor retention or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 48

Level 2

Riley wants to know whether the proposal to offer monthly lifting-safety and ergonomic training actually helps warehouse staff by reducing back-injury claims. Which evidence would be strongest?

A. A fair random comparison measured back-injury claims in both the plan group and the no-plan group.	**B.** Riley's friend says the idea feels promising but gives no data about back-injury claims.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured back-injury claims after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 49

Level 2

Maya wants to know whether the proposal to place compost bins in apartment lobbies actually helps apartment residents by reducing landfill waste from participating buildings. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how placing compost bins in apartment lobbies would work but does not measure landfill waste from participating buildings or compare groups.
C. People outside the project collected comparable before-and-after data on landfill waste from participating buildings.	**D.** A report measured landfill waste from participating buildings after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 50

Level 2

Sam wants to know whether the proposal to make new user profiles private by default actually helps new app users by reducing publicly visible profiles. Which evidence would be strongest?

A. Comparable sites each tried the plan and used the same method to track publicly visible profiles.	**B.** A report measured publicly visible profiles after the change but did not say what it was before the plan.
C. A brochure explains how making new user profiles private by default would work but does not measure publicly visible profiles or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 51

Level 2

Avery wants to know whether the proposal to reserve same-day appointment slots actually helps primary-care patients by reducing patient no-show rates. Which evidence would be strongest?

A. A brochure explains how reserving same-day appointment slots would work but does not measure patient no-show rates or compare groups.	**B.** Avery's friend says the idea feels promising but gives no data about patient no-show rates.
C. The evidence states who was measured, how the comparison worked, and what changed in patient no-show rates.	**D.** A report measured patient no-show rates after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 52

Level 2

Taylor wants to know whether the proposal to board passengers by seat zone actually helps domestic flight passengers by reducing average boarding time. Which evidence would be strongest?

A. The evidence covers many cases and measures average boarding time on both sides of the change.	**B.** A report measured average boarding time after the change but did not say what it was before the plan.
C. Taylor's friend says the idea feels promising but gives no data about average boarding time.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 53

Level 2

Morgan wants to know whether the proposal to launch an online apartment repair portal actually helps apartment tenants by reducing unresolved repair requests. Which evidence would be strongest?

A. A brochure explains how launching an online apartment repair portal would work but does not measure unresolved repair requests or compare groups.	**B.** A random test compared similar groups with and without the change, then measured unresolved repair requests.
C. Morgan's friend says the idea feels promising but gives no data about unresolved repair requests.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 54

Level 2

Casey wants to know whether the proposal to move fruit bowls to the front of the cafeteria line actually helps middle-school students by increasing fruit purchases. Which evidence would be strongest?

A. A report measured fruit purchases after the change but did not say what it was before the plan.	**B.** Casey's friend says the idea feels promising but gives no data about fruit purchases.
C. A brochure explains how moving fruit bowls to the front of the cafeteria line would work but does not measure fruit purchases or compare groups.	**D.** Independent researchers used the same method to measure fruit purchases before and after the plan.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 55

Level 2

Jordan wants to know whether the proposal to give support agents weekly script coaching actually helps support agents by reducing customer complaint rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Several similar settings tried the plan, and each one measured customer complaint rates the same way.
C. A brochure explains how giving support agents weekly script coaching would work but does not measure customer complaint rates or compare groups.	**D.** Jordan's friend says the idea feels promising but gives no data about customer complaint rates.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 56

Level 2

Riley wants to know whether the proposal to send automatic household water-leak alerts actually helps local homeowners by reducing average household water use. Which evidence would be strongest?

A. The study reported its sample size, comparison method, and results for average household water use.	**B.** A report measured average household water use after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A brochure explains how sending automatic household water-leak alerts would work but does not measure average household water use or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 57

Level 2

Maya wants to know whether the proposal to send body-camera activation reminders before patrol shifts actually helps patrol officers by reducing missing-camera-footage reports. Which evidence would be strongest?

A. Maya's friend says the idea feels promising but gives no data about missing-camera-footage reports.	**B.** A large, fair study measured missing-camera-footage reports before and after the change.
C. A brochure explains how sending body-camera activation reminders before patrol shifts would work but does not measure missing-camera-footage reports or compare groups.	**D.** A report measured missing-camera-footage reports after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 58

Level 2

Sam wants to know whether the proposal to offer online mail-ballot tracking actually helps mail voters by reducing phone calls asking ballot status. Which evidence would be strongest?

A. A brochure explains how offering online mail-ballot tracking would work but does not measure phone calls asking ballot status or compare groups.	**B.** A report measured phone calls asking ballot status after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Similar groups were randomly assigned to use or not use the plan, then phone calls asking ballot status was measured.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 59

Level 2

Avery wants to know whether the proposal to send spaced-review prompts for language vocabulary actually helps language learners by increasing vocabulary retention quiz scores. Which evidence would be strongest?

A. Avery's friend says the idea feels promising but gives no data about vocabulary retention quiz scores.	**B.** A team not connected to the proposal measured vocabulary retention quiz scores with the same method each time.
C. A brochure explains how sending spaced-review prompts for language vocabulary would work but does not measure vocabulary retention quiz scores or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 60

Level 2

Taylor wants to know whether the proposal to offer a beginner gym orientation actually helps new gym members by reducing new-member cancellations. Which evidence would be strongest?

A. Taylor's friend says the idea feels promising but gives no data about new-member cancellations.	**B.** A brochure explains how offering a beginner gym orientation would work but does not measure new-member cancellations or compare groups.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** The plan was tried in several similar places, with new-member cancellations measured consistently in each one.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 61

Level 2

Morgan wants to know whether the proposal to send weekly safe-driving feedback actually helps auto-insurance policyholders by reducing reported minor crashes. Which evidence would be strongest?

A. A report measured reported minor crashes after the change but did not say what it was before the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Morgan's friend says the idea feels promising but gives no data about reported minor crashes.	**D.** The report gave the sample size, comparison method, and measured result for reported minor crashes.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 62

Level 2

Casey wants to know whether the proposal to place corrections at the top of articles actually helps newsletter readers by increasing reader trust ratings. Which evidence would be strongest?

A. A report measured reader trust ratings after the change but did not say what it was before the plan.	**B.** A brochure explains how placing corrections at the top of articles would work but does not measure reader trust ratings or compare groups.
C. Many people were included, and researchers measured reader trust ratings before and after the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 63

Level 2

Jordan wants to know whether the proposal to require clearer price signs at vendor stalls actually helps weekend farmers market shoppers by reducing price disputes. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Jordan's friend says the idea feels promising but gives no data about price disputes.
C. Researchers randomly compared a plan group with a no-plan group and tracked price disputes.	**D.** A brochure explains how requiring clearer price signs at vendor stalls would work but does not measure price disputes or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 64

Level 2

Riley wants to know whether the proposal to send quiet-hours text reminders to hotel guests actually helps overnight hotel guests by reducing noise complaints from guest rooms. Which evidence would be strongest?

A. A report measured noise complaints from guest rooms after the change but did not say what it was before the plan.	**B.** Riley's friend says the idea feels promising but gives no data about noise complaints from guest rooms.
C. A brochure explains how sending quiet-hours text reminders to hotel guests would work but does not measure noise complaints from guest rooms or compare groups.	**D.** Outside researchers checked noise complaints from guest rooms before and after the plan using a consistent method.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

Sam wants to know whether the proposal to extend evening bus service until midnight actually helps late-shift workers by reducing late-shift commute complaints. Which evidence would be strongest?

A. Outside researchers checked late-shift commute complaints before and after the plan using a consistent method.	**B.** Sam's friend says the idea feels promising but gives no data about late-shift commute complaints.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured late-shift commute complaints after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 66

Level 3

Avery wants to know whether the proposal to require phone lockers during class actually helps ninth-grade students by reducing classroom disruption reports. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Multiple similar settings tracked classroom disruption reports using the same method after trying the plan.
C. A brochure explains how requiring phone lockers during class would work but does not measure classroom disruption reports or compare groups.	**D.** Avery's friend says the idea feels promising but gives no data about classroom disruption reports.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 67

Level 3

Taylor wants to know whether the proposal to send medication reminder texts before evening doses actually helps patients over 60 by reducing missed-dose reports. Which evidence would be strongest?

A. Taylor's friend says the idea feels promising but gives no data about missed-dose reports.	**B.** A report measured missed-dose reports after the change but did not say what it was before the plan.
C. Researchers listed how many cases were studied, how they compared them, and what happened to missed-dose reports.	**D.** A brochure explains how sending medication reminder texts before evening doses would work but does not measure missed-dose reports or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 68

Level 3

Morgan wants to know whether the proposal to test a Monday-through-Thursday workweek actually helps software engineers by reducing staff resignations. Which evidence would be strongest?

A. A brochure explains how testing a Monday-through-Thursday workweek would work but does not measure staff resignations or compare groups.	**B.** Morgan's friend says the idea feels promising but gives no data about staff resignations.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A fair before-and-after study used a large sample to track staff resignations.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 69

Level 3

Casey wants to know whether the proposal to add larger unit-price labels on shelf tags actually helps weekly grocery shoppers by reducing shopper overpayment complaints. Which evidence would be strongest?

A. Researchers randomly compared a plan group with a no-plan group and tracked shopper overpayment complaints.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A brochure explains how adding larger unit-price labels on shelf tags would work but does not measure shopper overpayment complaints or compare groups.	**D.** Casey's friend says the idea feels promising but gives no data about shopper overpayment complaints.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 70

Level 3

Jordan wants to know whether the proposal to waive late fines for children's books actually helps families checking out children's books by increasing library card renewals. Which evidence would be strongest?

A. A report measured library card renewals after the change but did not say what it was before the plan.	**B.** The measurement was done by an independent team using the same rules before and after.
C. A brochure explains how waiving late fines for children's books would work but does not measure library card renewals or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 71

Level 3

Riley wants to know whether the proposal to require two-factor login for site administrators actually helps site administrators by reducing admin account takeovers. Which evidence would be strongest?

A. A report measured admin account takeovers after the change but did not say what it was before the plan.	**B.** Riley's friend says the idea feels promising but gives no data about admin account takeovers.
C. Results from several similar places were checked with the same measure of admin account takeovers.	**D.** A brochure explains how requiring two-factor login for site administrators would work but does not measure admin account takeovers or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 72

Level 3

Maya wants to know whether the proposal to add brighter LED streetlights on Maple Street actually helps residents on Maple Street by reducing reported thefts. Which evidence would be strongest?

A. A report measured reported thefts after the change but did not say what it was before the plan.	**B.** A brochure explains how adding brighter LED streetlights on Maple Street would work but does not measure reported thefts or compare groups.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A study write-up included the sample size, method, and results for reported thefts.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 73

Level 3

Sam wants to know whether the proposal to expand peer tutoring in statistics actually helps first-year statistics students by increasing course pass rates. Which evidence would be strongest?

A. Sam's friend says the idea feels promising but gives no data about course pass rates.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Researchers used a large sample and checked course pass rates both before and after the change.	**D.** A report measured course pass rates after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 74

Level 3

Avery wants to know whether the proposal to show calorie labels on printed lunch menus actually helps lunch customers by reducing dessert orders. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured dessert orders after the change but did not say what it was before the plan.
C. A brochure explains how showing calorie labels on printed lunch menus would work but does not measure dessert orders or compare groups.	**D.** The plan was tested against a similar no-plan group chosen by random assignment.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 75

Level 3

Taylor wants to know whether the proposal to send overdraft warning texts before fees post actually helps checking-account customers by reducing overdraft fees. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** People outside the project collected comparable before-and-after data on overdraft fees.
C. A report measured overdraft fees after the change but did not say what it was before the plan.	**D.** A brochure explains how sending overdraft warning texts before fees post would work but does not measure overdraft fees or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 76

Level 3

Morgan wants to know whether the proposal to use timed-entry passes for weekend trail visits actually helps weekend trail hikers by reducing trail crowding complaints. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how using timed-entry passes for weekend trail visits would work but does not measure trail crowding complaints or compare groups.
C. Morgan's friend says the idea feels promising but gives no data about trail crowding complaints.	**D.** Comparable sites each tried the plan and used the same method to track trail crowding complaints.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 77

Level 3

Casey wants to know whether the proposal to offer free admission on Fridays actually helps local families by increasing family visits. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The evidence states who was measured, how the comparison worked, and what changed in family visits.
C. A report measured family visits after the change but did not say what it was before the plan.	**D.** Casey's friend says the idea feels promising but gives no data about family visits.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 78

Level 3

Jordan wants to know whether the proposal to add mandatory sideline concussion checks actually helps youth soccer players by reducing repeat head injuries. Which evidence would be strongest?

A. The evidence covers many cases and measures repeat head injuries on both sides of the change.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A report measured repeat head injuries after the change but did not say what it was before the plan.	**D.** Jordan's friend says the idea feels promising but gives no data about repeat head injuries.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 79

Level 3

Riley wants to know whether the proposal to send donation receipts within one day actually helps first-time donors by increasing donor retention. Which evidence would be strongest?

A. Riley's friend says the idea feels promising but gives no data about donor retention.	**B.** A report measured donor retention after the change but did not say what it was before the plan.
C. A brochure explains how sending donation receipts within one day would work but does not measure donor retention or compare groups.	**D.** A fair random comparison measured donor retention in both the plan group and the no-plan group.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 80

Level 3

Maya wants to know whether the proposal to offer monthly lifting-safety and ergonomic training actually helps warehouse staff by reducing back-injury claims. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how offering monthly lifting-safety and ergonomic training would work but does not measure back-injury claims or compare groups.
C. Independent researchers used the same method to measure back-injury claims before and after the plan.	**D.** Maya's friend says the idea feels promising but gives no data about back-injury claims.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 81

Level 3

Sam wants to know whether the proposal to place compost bins in apartment lobbies actually helps apartment residents by reducing landfill waste from participating buildings. Which evidence would be strongest?

A. A report measured landfill waste from participating buildings after the change but did not say what it was before the plan.	**B.** Several similar settings tried the plan, and each one measured landfill waste from participating buildings the same way.
C. Sam's friend says the idea feels promising but gives no data about landfill waste from participating buildings.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 82

Level 3

Avery wants to know whether the proposal to make new user profiles private by default actually helps new app users by reducing publicly visible profiles. Which evidence would be strongest?

A. The study reported its sample size, comparison method, and results for publicly visible profiles.	**B.** A report measured publicly visible profiles after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Avery's friend says the idea feels promising but gives no data about publicly visible profiles.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 83

Level 3

Taylor wants to know whether the proposal to reserve same-day appointment slots actually helps primary-care patients by reducing patient no-show rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Taylor's friend says the idea feels promising but gives no data about patient no-show rates.
C. A report measured patient no-show rates after the change but did not say what it was before the plan.	**D.** A large, fair study measured patient no-show rates before and after the change.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 84

Level 3

Morgan wants to know whether the proposal to board passengers by seat zone actually helps domestic flight passengers by reducing average boarding time. Which evidence would be strongest?

A. Morgan's friend says the idea feels promising but gives no data about average boarding time.	**B.** A random test compared similar groups with and without the change, then measured average boarding time.
C. A brochure explains how boarding passengers by seat zone would work but does not measure average boarding time or compare groups.	**D.** A report measured average boarding time after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 85

Level 3

Casey wants to know whether the proposal to launch an online apartment repair portal actually helps apartment tenants by reducing unresolved repair requests. Which evidence would be strongest?

A. A team not connected to the proposal measured unresolved repair requests with the same method each time.	**B.** A report measured unresolved repair requests after the change but did not say what it was before the plan.
C. Casey's friend says the idea feels promising but gives no data about unresolved repair requests.	**D.** A brochure explains how launching an online apartment repair portal would work but does not measure unresolved repair requests or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 86

Level 3

Jordan wants to know whether the proposal to move fruit bowls to the front of the cafeteria line actually helps middle-school students by increasing fruit purchases. Which evidence would be strongest?

A. Jordan's friend says the idea feels promising but gives no data about fruit purchases.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. The plan was tried in several similar places, with fruit purchases measured consistently in each one.	**D.** A brochure explains how moving fruit bowls to the front of the cafeteria line would work but does not measure fruit purchases or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 87

Level 3

Riley wants to know whether the proposal to give support agents weekly script coaching actually helps support agents by reducing customer complaint rates. Which evidence would be strongest?

A. A report measured customer complaint rates after the change but did not say what it was before the plan.	**B.** Riley's friend says the idea feels promising but gives no data about customer complaint rates.
C. The report gave the sample size, comparison method, and measured result for customer complaint rates.	**D.** A brochure explains how giving support agents weekly script coaching would work but does not measure customer complaint rates or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 88

Level 3

Maya wants to know whether the proposal to send automatic household water-leak alerts actually helps local homeowners by reducing average household water use. Which evidence would be strongest?

A. Maya's friend says the idea feels promising but gives no data about average household water use.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A brochure explains how sending automatic household water-leak alerts would work but does not measure average household water use or compare groups.	**D.** Many people were included, and researchers measured average household water use before and after the plan.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 89

Level 3

Sam wants to know whether the proposal to send body-camera activation reminders before patrol shifts actually helps patrol officers by reducing missing-camera-footage reports. Which evidence would be strongest?

A. A report measured missing-camera-footage reports after the change but did not say what it was before the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Similar groups were randomly assigned to use or not use the plan, then missing-camera-footage reports was measured.	**D.** Sam's friend says the idea feels promising but gives no data about missing-camera-footage reports.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 90

Level 3

Avery wants to know whether the proposal to offer online mail-ballot tracking actually helps mail voters by reducing phone calls asking ballot status. Which evidence would be strongest?

A. A report measured phone calls asking ballot status after the change but did not say what it was before the plan.	**B.** Avery's friend says the idea feels promising but gives no data about phone calls asking ballot status.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Outside researchers checked phone calls asking ballot status before and after the plan using a consistent method.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 91

Level 3

Taylor wants to know whether the proposal to send spaced-review prompts for language vocabulary actually helps language learners by increasing vocabulary retention quiz scores. Which evidence would be strongest?

A. Multiple similar settings tracked vocabulary retention quiz scores using the same method after trying the plan.	**B.** A report measured vocabulary retention quiz scores after the change but did not say what it was before the plan.
C. A brochure explains how sending spaced-review prompts for language vocabulary would work but does not measure vocabulary retention quiz scores or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 92

Level 3

Morgan wants to know whether the proposal to offer a beginner gym orientation actually helps new gym members by reducing new-member cancellations. Which evidence would be strongest?

A. A brochure explains how offering a beginner gym orientation would work but does not measure new-member cancellations or compare groups.	**B.** Researchers listed how many cases were studied, how they compared them, and what happened to new-member cancellations.
C. Morgan's friend says the idea feels promising but gives no data about new-member cancellations.	**D.** A report measured new-member cancellations after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 93

Level 3

Casey wants to know whether the proposal to send weekly safe-driving feedback actually helps auto-insurance policyholders by reducing reported minor crashes. Which evidence would be strongest?

A. A brochure explains how sending weekly safe-driving feedback would work but does not measure reported minor crashes or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A fair before-and-after study used a large sample to track reported minor crashes.	**D.** Casey's friend says the idea feels promising but gives no data about reported minor crashes.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 94

Level 3

Jordan wants to know whether the proposal to place corrections at the top of articles actually helps newsletter readers by increasing reader trust ratings. Which evidence would be strongest?

A. Researchers randomly compared a plan group with a no-plan group and tracked reader trust ratings.	**B.** A brochure explains how placing corrections at the top of articles would work but does not measure reader trust ratings or compare groups.
C. A report measured reader trust ratings after the change but did not say what it was before the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 95

Level 3

Riley wants to know whether the proposal to require clearer price signs at vendor stalls actually helps weekend farmers market shoppers by reducing price disputes. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The measurement was done by an independent team using the same rules before and after.
C. A report measured price disputes after the change but did not say what it was before the plan.	**D.** Riley's friend says the idea feels promising but gives no data about price disputes.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 96

Level 3

Maya wants to know whether the proposal to send quiet-hours text reminders to hotel guests actually helps overnight hotel guests by reducing noise complaints from guest rooms. Which evidence would be strongest?

A. Results from several similar places were checked with the same measure of noise complaints from guest rooms.	**B.** A report measured noise complaints from guest rooms after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Maya's friend says the idea feels promising but gives no data about noise complaints from guest rooms.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

Avery wants to know whether the proposal to extend evening bus service until midnight actually helps late-shift workers by reducing late-shift commute complaints. Which evidence would be strongest?

A. A brochure explains how extending evening bus service until midnight would work but does not measure late-shift commute complaints or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Avery's friend says the idea feels promising but gives no data about late-shift commute complaints.	**D.** Results from several similar places were checked with the same measure of late-shift commute complaints.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 98

Level 4

Taylor wants to know whether the proposal to require phone lockers during class actually helps ninth-grade students by reducing classroom disruption reports. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how requiring phone lockers during class would work but does not measure classroom disruption reports or compare groups.
C. A study write-up included the sample size, method, and results for classroom disruption reports.	**D.** Taylor's friend says the idea feels promising but gives no data about classroom disruption reports.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 99

Level 4

Morgan wants to know whether the proposal to send medication reminder texts before evening doses actually helps patients over 60 by reducing missed-dose reports. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Researchers used a large sample and checked missed-dose reports both before and after the change.
C. A brochure explains how sending medication reminder texts before evening doses would work but does not measure missed-dose reports or compare groups.	**D.** Morgan's friend says the idea feels promising but gives no data about missed-dose reports.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 100

Level 4

Casey wants to know whether the proposal to test a Monday-through-Thursday workweek actually helps software engineers by reducing staff resignations. Which evidence would be strongest?

A. The plan was tested against a similar no-plan group chosen by random assignment.	**B.** A report measured staff resignations after the change but did not say what it was before the plan.
C. A brochure explains how testing a Monday-through-Thursday workweek would work but does not measure staff resignations or compare groups.	**D.** Casey's friend says the idea feels promising but gives no data about staff resignations.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 101

Level 4

Jordan wants to know whether the proposal to add larger unit-price labels on shelf tags actually helps weekly grocery shoppers by reducing shopper overpayment complaints. Which evidence would be strongest?

A. A brochure explains how adding larger unit-price labels on shelf tags would work but does not measure shopper overpayment complaints or compare groups.	**B.** Jordan's friend says the idea feels promising but gives no data about shopper overpayment complaints.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** The measurement was done by an independent team using the same rules before and after.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 102

Level 4

Riley wants to know whether the proposal to waive late fines for children's books actually helps families checking out children's books by increasing library card renewals. Which evidence would be strongest?

A. A report measured library card renewals after the change but did not say what it was before the plan.	**B.** A brochure explains how waiving late fines for children's books would work but does not measure library card renewals or compare groups.
C. Comparable sites each tried the plan and used the same method to track library card renewals.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 103

Level 4

Maya wants to know whether the proposal to require two-factor login for site administrators actually helps site administrators by reducing admin account takeovers. Which evidence would be strongest?

A. Maya's friend says the idea feels promising but gives no data about admin account takeovers.	**B.** The evidence states who was measured, how the comparison worked, and what changed in admin account takeovers.
C. A report measured admin account takeovers after the change but did not say what it was before the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 104

Level 4

Sam wants to know whether the proposal to add brighter LED streetlights on Maple Street actually helps residents on Maple Street by reducing reported thefts. Which evidence would be strongest?

A. The evidence covers many cases and measures reported thefts on both sides of the change.	**B.** Sam's friend says the idea feels promising but gives no data about reported thefts.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A brochure explains how adding brighter LED streetlights on Maple Street would work but does not measure reported thefts or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 105

Level 4

Avery wants to know whether the proposal to expand peer tutoring in statistics actually helps first-year statistics students by increasing course pass rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A fair random comparison measured course pass rates in both the plan group and the no-plan group.
C. A brochure explains how expanding peer tutoring in statistics would work but does not measure course pass rates or compare groups.	**D.** Avery's friend says the idea feels promising but gives no data about course pass rates.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 106

Level 4

Taylor wants to know whether the proposal to show calorie labels on printed lunch menus actually helps lunch customers by reducing dessert orders. Which evidence would be strongest?

A. People outside the project collected comparable before-and-after data on dessert orders.	**B.** Taylor's friend says the idea feels promising but gives no data about dessert orders.
C. A brochure explains how showing calorie labels on printed lunch menus would work but does not measure dessert orders or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 107

Level 4

Morgan wants to know whether the proposal to send overdraft warning texts before fees post actually helps checking-account customers by reducing overdraft fees. Which evidence would be strongest?

A. Several similar settings tried the plan, and each one measured overdraft fees the same way.	**B.** A report measured overdraft fees after the change but did not say what it was before the plan.
C. Morgan's friend says the idea feels promising but gives no data about overdraft fees.	**D.** A brochure explains how sending overdraft warning texts before fees post would work but does not measure overdraft fees or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 108

Level 4

Casey wants to know whether the proposal to use timed-entry passes for weekend trail visits actually helps weekend trail hikers by reducing trail crowding complaints. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The study reported its sample size, comparison method, and results for trail crowding complaints.
C. A brochure explains how using timed-entry passes for weekend trail visits would work but does not measure trail crowding complaints or compare groups.	**D.** A report measured trail crowding complaints after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 109

Level 4

Jordan wants to know whether the proposal to offer free admission on Fridays actually helps local families by increasing family visits. Which evidence would be strongest?

A. Jordan's friend says the idea feels promising but gives no data about family visits.	**B.** A brochure explains how offering free admission on Fridays would work but does not measure family visits or compare groups.
C. A large, fair study measured family visits before and after the change.	**D.** A report measured family visits after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 110

Level 4

Riley wants to know whether the proposal to add mandatory sideline concussion checks actually helps youth soccer players by reducing repeat head injuries. Which evidence would be strongest?

A. A report measured repeat head injuries after the change but did not say what it was before the plan.	**B.** Riley's friend says the idea feels promising but gives no data about repeat head injuries.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A random test compared similar groups with and without the change, then measured repeat head injuries.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 111

Level 4

Maya wants to know whether the proposal to send donation receipts within one day actually helps first-time donors by increasing donor retention. Which evidence would be strongest?

A. Independent researchers used the same method to measure donor retention before and after the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A brochure explains how sending donation receipts within one day would work but does not measure donor retention or compare groups.	**D.** A report measured donor retention after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 112

Level 4

Sam wants to know whether the proposal to offer monthly lifting-safety and ergonomic training actually helps warehouse staff by reducing back-injury claims. Which evidence would be strongest?

A. A brochure explains how offering monthly lifting-safety and ergonomic training would work but does not measure back-injury claims or compare groups.	**B.** The plan was tried in several similar places, with back-injury claims measured consistently in each one.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A report measured back-injury claims after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 113

Level 4

Avery wants to know whether the proposal to place compost bins in apartment lobbies actually helps apartment residents by reducing landfill waste from participating buildings. Which evidence would be strongest?

A. A brochure explains how placing compost bins in apartment lobbies would work but does not measure landfill waste from participating buildings or compare groups.	**B.** A report measured landfill waste from participating buildings after the change but did not say what it was before the plan.
C. The report gave the sample size, comparison method, and measured result for landfill waste from participating buildings.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 114

Level 4

Taylor wants to know whether the proposal to make new user profiles private by default actually helps new app users by reducing publicly visible profiles. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Taylor's friend says the idea feels promising but gives no data about publicly visible profiles.
C. A report measured publicly visible profiles after the change but did not say what it was before the plan.	**D.** Many people were included, and researchers measured publicly visible profiles before and after the plan.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 115

Level 4

Morgan wants to know whether the proposal to reserve same-day appointment slots actually helps primary-care patients by reducing patient no-show rates. Which evidence would be strongest?

A. Similar groups were randomly assigned to use or not use the plan, then patient no-show rates was measured.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Morgan's friend says the idea feels promising but gives no data about patient no-show rates.	**D.** A report measured patient no-show rates after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 116

Level 4

Casey wants to know whether the proposal to board passengers by seat zone actually helps domestic flight passengers by reducing average boarding time. Which evidence would be strongest?

A. A report measured average boarding time after the change but did not say what it was before the plan.	**B.** A team not connected to the proposal measured average boarding time with the same method each time.
C. Casey's friend says the idea feels promising but gives no data about average boarding time.	**D.** A brochure explains how boarding passengers by seat zone would work but does not measure average boarding time or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 117

Level 4

Jordan wants to know whether the proposal to launch an online apartment repair portal actually helps apartment tenants by reducing unresolved repair requests. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Multiple similar settings tracked unresolved repair requests using the same method after trying the plan.
C. A report measured unresolved repair requests after the change but did not say what it was before the plan.	**D.** A brochure explains how launching an online apartment repair portal would work but does not measure unresolved repair requests or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 118

Level 4

Riley wants to know whether the proposal to move fruit bowls to the front of the cafeteria line actually helps middle-school students by increasing fruit purchases. Which evidence would be strongest?

A. Researchers listed how many cases were studied, how they compared them, and what happened to fruit purchases.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A brochure explains how moving fruit bowls to the front of the cafeteria line would work but does not measure fruit purchases or compare groups.	**D.** Riley's friend says the idea feels promising but gives no data about fruit purchases.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 119

Level 4

Maya wants to know whether the proposal to give support agents weekly script coaching actually helps support agents by reducing customer complaint rates. Which evidence would be strongest?

A. A report measured customer complaint rates after the change but did not say what it was before the plan.	**B.** A brochure explains how giving support agents weekly script coaching would work but does not measure customer complaint rates or compare groups.
C. Maya's friend says the idea feels promising but gives no data about customer complaint rates.	**D.** A fair before-and-after study used a large sample to track customer complaint rates.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 120

Level 4

Sam wants to know whether the proposal to send automatic household water-leak alerts actually helps local homeowners by reducing average household water use. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how sending automatic household water-leak alerts would work but does not measure average household water use or compare groups.
C. Researchers randomly compared a plan group with a no-plan group and tracked average household water use.	**D.** A report measured average household water use after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 121

Level 4

Avery wants to know whether the proposal to send body-camera activation reminders before patrol shifts actually helps patrol officers by reducing missing-camera-footage reports. Which evidence would be strongest?

A. A brochure explains how sending body-camera activation reminders before patrol shifts would work but does not measure missing-camera-footage reports or compare groups.	**B.** Outside researchers checked missing-camera-footage reports before and after the plan using a consistent method.
C. Avery's friend says the idea feels promising but gives no data about missing-camera-footage reports.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 122

Level 4

Taylor wants to know whether the proposal to offer online mail-ballot tracking actually helps mail voters by reducing phone calls asking ballot status. Which evidence would be strongest?

A. Results from several similar places were checked with the same measure of phone calls asking ballot status.	**B.** A brochure explains how offering online mail-ballot tracking would work but does not measure phone calls asking ballot status or compare groups.
C. A report measured phone calls asking ballot status after the change but did not say what it was before the plan.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 123

Level 4

Morgan wants to know whether the proposal to send spaced-review prompts for language vocabulary actually helps language learners by increasing vocabulary retention quiz scores. Which evidence would be strongest?

A. A brochure explains how sending spaced-review prompts for language vocabulary would work but does not measure vocabulary retention quiz scores or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Morgan's friend says the idea feels promising but gives no data about vocabulary retention quiz scores.	**D.** A study write-up included the sample size, method, and results for vocabulary retention quiz scores.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 124

Level 4

Casey wants to know whether the proposal to offer a beginner gym orientation actually helps new gym members by reducing new-member cancellations. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured new-member cancellations after the change but did not say what it was before the plan.
C. Researchers used a large sample and checked new-member cancellations both before and after the change.	**D.** Casey's friend says the idea feels promising but gives no data about new-member cancellations.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 125

Level 4

Jordan wants to know whether the proposal to send weekly safe-driving feedback actually helps auto-insurance policyholders by reducing reported minor crashes. Which evidence would be strongest?

A. A brochure explains how sending weekly safe-driving feedback would work but does not measure reported minor crashes or compare groups.	**B.** A report measured reported minor crashes after the change but did not say what it was before the plan.
C. Jordan's friend says the idea feels promising but gives no data about reported minor crashes.	**D.** The plan was tested against a similar no-plan group chosen by random assignment.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 126

Level 4

Riley wants to know whether the proposal to place corrections at the top of articles actually helps newsletter readers by increasing reader trust ratings. Which evidence would be strongest?

A. A report measured reader trust ratings after the change but did not say what it was before the plan.	**B.** A brochure explains how placing corrections at the top of articles would work but does not measure reader trust ratings or compare groups.
C. The measurement was done by an independent team using the same rules before and after.	**D.** Riley's friend says the idea feels promising but gives no data about reader trust ratings.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 127

Level 4

Maya wants to know whether the proposal to require clearer price signs at vendor stalls actually helps weekend farmers market shoppers by reducing price disputes. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured price disputes after the change but did not say what it was before the plan.
C. Comparable sites each tried the plan and used the same method to track price disputes.	**D.** A brochure explains how requiring clearer price signs at vendor stalls would work but does not measure price disputes or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 128

Level 4

Sam wants to know whether the proposal to send quiet-hours text reminders to hotel guests actually helps overnight hotel guests by reducing noise complaints from guest rooms. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how sending quiet-hours text reminders to hotel guests would work but does not measure noise complaints from guest rooms or compare groups.
C. A report measured noise complaints from guest rooms after the change but did not say what it was before the plan.	**D.** The evidence states who was measured, how the comparison worked, and what changed in noise complaints from guest rooms.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

Taylor wants to know whether the proposal to extend evening bus service until midnight actually helps late-shift workers by reducing late-shift commute complaints. Which evidence would be strongest?

A. The evidence states who was measured, how the comparison worked, and what changed in late-shift commute complaints.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A report measured late-shift commute complaints after the change but did not say what it was before the plan.	**D.** A brochure explains how extending evening bus service until midnight would work but does not measure late-shift commute complaints or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 130

Level 5

Morgan wants to know whether the proposal to require phone lockers during class actually helps ninth-grade students by reducing classroom disruption reports. Which evidence would be strongest?

A. A report measured classroom disruption reports after the change but did not say what it was before the plan.	**B.** The evidence covers many cases and measures classroom disruption reports on both sides of the change.
C. A brochure explains how requiring phone lockers during class would work but does not measure classroom disruption reports or compare groups.	**D.** Morgan's friend says the idea feels promising but gives no data about classroom disruption reports.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 131

Level 5

Casey wants to know whether the proposal to send medication reminder texts before evening doses actually helps patients over 60 by reducing missed-dose reports. Which evidence would be strongest?

A. A brochure explains how sending medication reminder texts before evening doses would work but does not measure missed-dose reports or compare groups.	**B.** Casey's friend says the idea feels promising but gives no data about missed-dose reports.
C. A fair random comparison measured missed-dose reports in both the plan group and the no-plan group.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 132

Level 5

Jordan wants to know whether the proposal to test a Monday-through-Thursday workweek actually helps software engineers by reducing staff resignations. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured staff resignations after the change but did not say what it was before the plan.
C. Jordan's friend says the idea feels promising but gives no data about staff resignations.	**D.** People outside the project collected comparable before-and-after data on staff resignations.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 133

Level 5

Riley wants to know whether the proposal to add larger unit-price labels on shelf tags actually helps weekly grocery shoppers by reducing shopper overpayment complaints. Which evidence would be strongest?

A. Comparable sites each tried the plan and used the same method to track shopper overpayment complaints.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A report measured shopper overpayment complaints after the change but did not say what it was before the plan.	**D.** Riley's friend says the idea feels promising but gives no data about shopper overpayment complaints.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 134

Level 5

Maya wants to know whether the proposal to waive late fines for children's books actually helps families checking out children's books by increasing library card renewals. Which evidence would be strongest?

A. A report measured library card renewals after the change but did not say what it was before the plan.	**B.** The study reported its sample size, comparison method, and results for library card renewals.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** Maya's friend says the idea feels promising but gives no data about library card renewals.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 135

Level 5

Sam wants to know whether the proposal to require two-factor login for site administrators actually helps site administrators by reducing admin account takeovers. Which evidence would be strongest?

A. A report measured admin account takeovers after the change but did not say what it was before the plan.	**B.** Sam's friend says the idea feels promising but gives no data about admin account takeovers.
C. A large, fair study measured admin account takeovers before and after the change.	**D.** A brochure explains how requiring two-factor login for site administrators would work but does not measure admin account takeovers or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 136

Level 5

Avery wants to know whether the proposal to add brighter LED streetlights on Maple Street actually helps residents on Maple Street by reducing reported thefts. Which evidence would be strongest?

A. A brochure explains how adding brighter LED streetlights on Maple Street would work but does not measure reported thefts or compare groups.	**B.** A report measured reported thefts after the change but did not say what it was before the plan.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A random test compared similar groups with and without the change, then measured reported thefts.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 137

Level 5

Taylor wants to know whether the proposal to expand peer tutoring in statistics actually helps first-year statistics students by increasing course pass rates. Which evidence would be strongest?

A. Independent researchers used the same method to measure course pass rates before and after the plan.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. Taylor's friend says the idea feels promising but gives no data about course pass rates.	**D.** A brochure explains how expanding peer tutoring in statistics would work but does not measure course pass rates or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 138

Level 5

Morgan wants to know whether the proposal to show calorie labels on printed lunch menus actually helps lunch customers by reducing dessert orders. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Several similar settings tried the plan, and each one measured dessert orders the same way.
C. Morgan's friend says the idea feels promising but gives no data about dessert orders.	**D.** A brochure explains how showing calorie labels on printed lunch menus would work but does not measure dessert orders or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 139

Level 5

Casey wants to know whether the proposal to send overdraft warning texts before fees post actually helps checking-account customers by reducing overdraft fees. Which evidence would be strongest?

A. Casey's friend says the idea feels promising but gives no data about overdraft fees.	**B.** The report gave the sample size, comparison method, and measured result for overdraft fees.
C. A report measured overdraft fees after the change but did not say what it was before the plan.	**D.** A brochure explains how sending overdraft warning texts before fees post would work but does not measure overdraft fees or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 140

Level 5

Jordan wants to know whether the proposal to use timed-entry passes for weekend trail visits actually helps weekend trail hikers by reducing trail crowding complaints. Which evidence would be strongest?

A. Many people were included, and researchers measured trail crowding complaints before and after the plan.	**B.** Jordan's friend says the idea feels promising but gives no data about trail crowding complaints.
C. A report measured trail crowding complaints after the change but did not say what it was before the plan.	**D.** A brochure explains how using timed-entry passes for weekend trail visits would work but does not measure trail crowding complaints or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 141

Level 5

Riley wants to know whether the proposal to offer free admission on Fridays actually helps local families by increasing family visits. Which evidence would be strongest?

A. Riley's friend says the idea feels promising but gives no data about family visits.	**B.** A report measured family visits after the change but did not say what it was before the plan.
C. A brochure explains how offering free admission on Fridays would work but does not measure family visits or compare groups.	**D.** Similar groups were randomly assigned to use or not use the plan, then family visits was measured.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 142

Level 5

Maya wants to know whether the proposal to add mandatory sideline concussion checks actually helps youth soccer players by reducing repeat head injuries. Which evidence would be strongest?

A. A brochure explains how adding mandatory sideline concussion checks would work but does not measure repeat head injuries or compare groups.	**B.** Maya's friend says the idea feels promising but gives no data about repeat head injuries.
C. A team not connected to the proposal measured repeat head injuries with the same method each time.	**D.** A report measured repeat head injuries after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 143

Level 5

Sam wants to know whether the proposal to send donation receipts within one day actually helps first-time donors by increasing donor retention. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The plan was tried in several similar places, with donor retention measured consistently in each one.
C. A brochure explains how sending donation receipts within one day would work but does not measure donor retention or compare groups.	**D.** A report measured donor retention after the change but did not say what it was before the plan.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 144

Level 5

Avery wants to know whether the proposal to offer monthly lifting-safety and ergonomic training actually helps warehouse staff by reducing back-injury claims. Which evidence would be strongest?

A. Researchers listed how many cases were studied, how they compared them, and what happened to back-injury claims.	**B.** A report measured back-injury claims after the change but did not say what it was before the plan.
C. A brochure explains how offering monthly lifting-safety and ergonomic training would work but does not measure back-injury claims or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 145

Level 5

Taylor wants to know whether the proposal to place compost bins in apartment lobbies actually helps apartment residents by reducing landfill waste from participating buildings. Which evidence would be strongest?

A. A report measured landfill waste from participating buildings after the change but did not say what it was before the plan.	**B.** A brochure explains how placing compost bins in apartment lobbies would work but does not measure landfill waste from participating buildings or compare groups.
C. Three people on social media say they like the idea after hearing about it, but no results are reported.	**D.** A fair before-and-after study used a large sample to track landfill waste from participating buildings.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 146

Level 5

Morgan wants to know whether the proposal to make new user profiles private by default actually helps new app users by reducing publicly visible profiles. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Morgan's friend says the idea feels promising but gives no data about publicly visible profiles.
C. Researchers randomly compared a plan group with a no-plan group and tracked publicly visible profiles.	**D.** A brochure explains how making new user profiles private by default would work but does not measure publicly visible profiles or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 147

Level 5

Casey wants to know whether the proposal to reserve same-day appointment slots actually helps primary-care patients by reducing patient no-show rates. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A brochure explains how reserving same-day appointment slots would work but does not measure patient no-show rates or compare groups.
C. Casey's friend says the idea feels promising but gives no data about patient no-show rates.	**D.** Outside researchers checked patient no-show rates before and after the plan using a consistent method.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 148

Level 5

Jordan wants to know whether the proposal to board passengers by seat zone actually helps domestic flight passengers by reducing average boarding time. Which evidence would be strongest?

A. A report measured average boarding time after the change but did not say what it was before the plan.	**B.** Jordan's friend says the idea feels promising but gives no data about average boarding time.
C. Multiple similar settings tracked average boarding time using the same method after trying the plan.	**D.** A brochure explains how boarding passengers by seat zone would work but does not measure average boarding time or compare groups.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 149

Level 5

Riley wants to know whether the proposal to launch an online apartment repair portal actually helps apartment tenants by reducing unresolved repair requests. Which evidence would be strongest?

A. A brochure explains how launching an online apartment repair portal would work but does not measure unresolved repair requests or compare groups.	**B.** Riley's friend says the idea feels promising but gives no data about unresolved repair requests.
C. A study write-up included the sample size, method, and results for unresolved repair requests.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 150

Level 5

Maya wants to know whether the proposal to move fruit bowls to the front of the cafeteria line actually helps middle-school students by increasing fruit purchases. Which evidence would be strongest?

A. A report measured fruit purchases after the change but did not say what it was before the plan.	**B.** Maya's friend says the idea feels promising but gives no data about fruit purchases.
C. A brochure explains how moving fruit bowls to the front of the cafeteria line would work but does not measure fruit purchases or compare groups.	**D.** Researchers used a large sample and checked fruit purchases both before and after the change.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 151

Level 5

Sam wants to know whether the proposal to give support agents weekly script coaching actually helps support agents by reducing customer complaint rates. Which evidence would be strongest?

A. The plan was tested against a similar no-plan group chosen by random assignment.	**B.** Sam's friend says the idea feels promising but gives no data about customer complaint rates.
C. A brochure explains how giving support agents weekly script coaching would work but does not measure customer complaint rates or compare groups.	**D.** Three people on social media say they like the idea after hearing about it, but no results are reported.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

Question 152

Level 5

Avery wants to know whether the proposal to send automatic household water-leak alerts actually helps local homeowners by reducing average household water use. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The measurement was done by an independent team using the same rules before and after.
C. Avery's friend says the idea feels promising but gives no data about average household water use.	**D.** A brochure explains how sending automatic household water-leak alerts would work but does not measure average household water use or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 153

Level 5

Taylor wants to know whether the proposal to send body-camera activation reminders before patrol shifts actually helps patrol officers by reducing missing-camera-footage reports. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Taylor's friend says the idea feels promising but gives no data about missing-camera-footage reports.
C. Results from several similar places were checked with the same measure of missing-camera-footage reports.	**D.** A report measured missing-camera-footage reports after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 154

Level 5

Morgan wants to know whether the proposal to offer online mail-ballot tracking actually helps mail voters by reducing phone calls asking ballot status. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A report measured phone calls asking ballot status after the change but did not say what it was before the plan.
C. A brochure explains how offering online mail-ballot tracking would work but does not measure phone calls asking ballot status or compare groups.	**D.** The evidence states who was measured, how the comparison worked, and what changed in phone calls asking ballot status.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

C. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 155

Level 5

Casey wants to know whether the proposal to send spaced-review prompts for language vocabulary actually helps language learners by increasing vocabulary retention quiz scores. Which evidence would be strongest?

A. The evidence covers many cases and measures vocabulary retention quiz scores on both sides of the change.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A report measured vocabulary retention quiz scores after the change but did not say what it was before the plan.	**D.** A brochure explains how sending spaced-review prompts for language vocabulary would work but does not measure vocabulary retention quiz scores or compare groups.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 156

Level 5

Jordan wants to know whether the proposal to offer a beginner gym orientation actually helps new gym members by reducing new-member cancellations. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** A fair random comparison measured new-member cancellations in both the plan group and the no-plan group.
C. A report measured new-member cancellations after the change but did not say what it was before the plan.	**D.** Jordan's friend says the idea feels promising but gives no data about new-member cancellations.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

Question 157

Level 5

Riley wants to know whether the proposal to send weekly safe-driving feedback actually helps auto-insurance policyholders by reducing reported minor crashes. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** Riley's friend says the idea feels promising but gives no data about reported minor crashes.
C. People outside the project collected comparable before-and-after data on reported minor crashes.	**D.** A report measured reported minor crashes after the change but did not say what it was before the plan.

Answer: C. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is C because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

C. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

Question 158

Level 5

Maya wants to know whether the proposal to place corrections at the top of articles actually helps newsletter readers by increasing reader trust ratings. Which evidence would be strongest?

A. A brochure explains how placing corrections at the top of articles would work but does not measure reader trust ratings or compare groups.	**B.** Three people on social media say they like the idea after hearing about it, but no results are reported.
C. A report measured reader trust ratings after the change but did not say what it was before the plan.	**D.** Comparable sites each tried the plan and used the same method to track reader trust ratings.

Answer: D. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is D because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

B. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

C. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.

D. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

Question 159

Level 5

Sam wants to know whether the proposal to require clearer price signs at vendor stalls actually helps weekend farmers market shoppers by reducing price disputes. Which evidence would be strongest?

A. Three people on social media say they like the idea after hearing about it, but no results are reported.	**B.** The study reported its sample size, comparison method, and results for price disputes.
C. Sam's friend says the idea feels promising but gives no data about price disputes.	**D.** A brochure explains how requiring clearer price signs at vendor stalls would work but does not measure price disputes or compare groups.

Answer: B. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is B because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Not correct. A few reactions on social media are too thin and unmeasured to be strong evidence about the result.

B. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

Question 160

Level 5

Avery wants to know whether the proposal to send quiet-hours text reminders to hotel guests actually helps overnight hotel guests by reducing noise complaints from guest rooms. Which evidence would be strongest?

A. A large, fair study measured noise complaints from guest rooms before and after the change.	**B.** A brochure explains how sending quiet-hours text reminders to hotel guests would work but does not measure noise complaints from guest rooms or compare groups.
C. Avery's friend says the idea feels promising but gives no data about noise complaints from guest rooms.	**D.** A report measured noise complaints from guest rooms after the change but did not say what it was before the plan.

Answer: A. The strongest option measures the result in a fair way, often with a comparison group.

How to work it out. To uncover the answer, compare how directly and fairly each option tests the claim. The correct choice is A because it gives stronger measurement, comparison, sample, or method than the alternatives.

A. Correct. This is the strongest evidence because it measures the claimed result in a fairer way, usually with a larger sample, a comparison, repeated settings, or a clear method.

B. Not correct. A brochure can explain how a plan is supposed to work, but explanation is not the same as evidence that it did work.

C. Not correct. A friend's impression is weak evidence because it gives no measured result and no fair comparison.

D. Not correct. Measuring only after the change leaves out the baseline, so it is hard to tell whether anything improved.
