Skill 08

Detect Logical Gaps

Does the Logic Follow?

160 Items	**1-5** Levels	**Find the step that does not follow.** Objective

Essential question. Does the conclusion really follow from the evidence?

This PDF is designed for classroom use. It gives teachers a rigorous introduction to the skill, a repeatable solving routine, likely student confusions, a worked example, and the full XiXteen item set with choice-level feedback.

Generated from the current XiXteen corpus on 2026-10-29.

Skill 08

Detect Logical Gaps

Does the Logic Follow?

Find the step that does not follow. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	Does the conclusion really follow from the evidence?
Why it matters	A logical gap appears when the conclusion reaches farther than the evidence. The facts may be true, the source may be decent, and the wording may be clear, yet the argument still may not follow.
Conceptual core	Logical gaps occur when the evidence is asked to do more than it can do. Students should learn to compare the exact scope of the evidence with the exact scope of the conclusion. Gaps often involve quantity, time, group, certainty, causation, or universality. This skill is not about whether the conclusion is false; it is about whether this argument has earned it.
Student method	Compare what the evidence says with what the conclusion adds. Watch for jumps from some to all, average to every person, possible to certain, or before-after to caused-by.
Analogy	Logic is a staircase. A gap is a missing step; you may see the upper floor, but you cannot simply pretend the step is there.
Assessment focus	A good answer identifies the precise leap from evidence to conclusion rather than attacking the topic generally.

Teaching Sequence

1. State what the evidence actually shows in one careful sentence.

2. State what the conclusion adds.

3. Look for jumps from some to all, possible to certain, short term to long term, or one group to another.

4. Choose the answer that names the unsupported jump.

Common Confusions To Watch For

1. Students may reject a conclusion because they dislike it rather than because it fails to follow.

2. Students may accept a conclusion because the evidence is true.

3. Students may overlook small words like all, always, only, or proves.

Teacher Prompts

1. What does the evidence show only?

2. What extra thing does the conclusion claim?

3. Which word makes the conclusion stronger than the evidence?

Worked Example

Scenario	A survey finds that most students in one art class liked a new grading rubric, so the school says every student will prefer it.
Teacher think-aloud	The evidence is about one class and most students in that class. The conclusion expands to every student in the school. That group and certainty jump is the gap.
Student takeaway	True evidence can still be too narrow for the conclusion.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. Eighteen of 24 students in one art class say they prefer a new grading rubric. The principal announces, 'Every student in our 600-student school prefers it.' No other students were asked.

What To Do

1. Complete: 'The evidence covers ___, but the conclusion covers ___.'

2. Rewrite the conclusion as one sentence that the survey actually supports.

3. Name one additional kind of evidence needed before making a claim about school-wide preferences.

Check before reading the answer. Does your rewrite preserve both the actual sample and the fact that six surveyed students did not prefer the rubric?

Model Answer

The evidence covers 24 students in one art class, but the conclusion covers all 600 students. A majority of the surveyed art class, 18 of 24 students, preferred the new rubric. A school-wide estimate would need a representative sample across classes; even that would not justify saying every student agrees.

Why it is adequate. It narrows the claim to the evidence and separates a statement about a majority from a statement about everyone.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

In a memo about evening bus service for late-shift workers, Riley writes, "During a small trial of extending evening bus service until midnight, late-shift commute complaints fell by 22% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 2

Level 1

Maya says, "Most ninth-grade students asked in a survey liked requiring phone lockers during class. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim moves from what most surveyed people liked to what everyone will benefit from.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 3

Level 1

A report says the average result improved after sending medication reminder texts before evening doses. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The average change is used as proof that every individual changed the same way.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 4

Level 1

At a planning meeting about a four-day workweek test for software engineers, Avery says, "In one group that tried testing a Monday-through-Thursday workweek, staff resignations fell by 15% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument uses one example, which can be a helpful starting point for discussion.
C. The argument gives the result before stating the recommendation.	**D.** The argument generalizes from one case to every case without enough support.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 5

Level 1

In a memo about larger grocery unit-price labels, Taylor writes, "During a small trial of adding larger unit-price labels on shelf tags, shopper overpayment complaints fell by 27% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 6

Level 1

Morgan says, "Most families checking out children's books asked in a survey liked waiving late fines for children's books. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** Most survey approval is used as proof that every affected person will be helped.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 7

Level 1

A report says the average result improved after requiring two-factor login for site administrators. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The group average is assumed to show what happened to each individual person.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 8

Level 1

At a planning meeting about brighter streetlights on Maple Street, Jordan says, "In one group that tried adding brighter LED streetlights on Maple Street, reported thefts fell by 12% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument gives the result before stating the recommendation.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** One successful example is used as if it proves the result will happen everywhere.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 9

Level 1

In a memo about peer tutoring for first-year statistics students, Riley writes, "During a small trial of expanding peer tutoring in statistics, course pass rates rose by 11% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The action is assumed to be the cause just because the change came after it.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 10

Level 1

Maya says, "Most lunch customers asked in a survey liked showing calorie labels on printed lunch menus. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** Liking the plan is treated as proof that the plan benefits every person affected.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 11

Level 1

A report says the average result improved after sending overdraft warning texts before fees post. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The reasoning stretches an average improvement into the claim that everyone improved.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 12

Level 1

At a planning meeting about timed-entry passes for weekend park trails, Avery says, "In one group that tried using timed-entry passes for weekend trail visits, trail crowding complaints fell by 33% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument uses one example, which can be a helpful starting point for discussion.
C. The argument gives the result before stating the recommendation.	**D.** One group improved, but that does not show all similar settings will improve too.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 13

Level 1

In a memo about free Friday museum admission, Taylor writes, "During a small trial of offering free admission on Fridays, family visits rose by 29% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The reasoning moves from sequence to cause without checking what else changed.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 14

Level 1

Morgan says, "Most youth soccer players asked in a survey liked adding mandatory sideline concussion checks. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. A survey of most people is assumed to show that every person will benefit.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 15

Level 1

A report says the average result improved after sending donation receipts within one day. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** A group-level result is read as if it proves the same result for every person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 16

Level 1

At a planning meeting about warehouse ergonomic training, Jordan says, "In one group that tried offering monthly lifting-safety and ergonomic training, back-injury claims fell by 20% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. One test is assumed to be enough to show the plan will work in every setting.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 17

Level 1

In a memo about apartment-lobby compost bins, Riley writes, "During a small trial of placing compost bins in apartment lobbies, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** Timing is counted as enough evidence even though another cause could explain the result.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 18

Level 1

Maya says, "Most new app users asked in a survey liked making new user profiles private by default. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. People liking the plan is confused with evidence that the plan helps everyone.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 19

Level 1

A report says the average result improved after reserving same-day appointment slots. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** Some people may not improve even when the average does, and the argument misses that.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 20

Level 1

At a planning meeting about seat-zone airline boarding, Avery says, "In one group that tried boarding passengers by seat zone, average boarding time fell by 9% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 21

Level 1

In a memo about an online apartment repair portal, Taylor writes, "During a small trial of launching an online apartment repair portal, unresolved repair requests fell by 26% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The memo uses a small trial, which may still provide a clue worth checking.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 22

Level 1

Morgan says, "Most middle-school students asked in a survey liked moving fruit bowls to the front of the cafeteria line. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim moves from what most surveyed people liked to what everyone will benefit from.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 23

Level 1

A report says the average result improved after giving support agents weekly script coaching. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The average change is used as proof that every individual changed the same way.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 24

Level 1

At a planning meeting about household water-leak alerts, Jordan says, "In one group that tried sending automatic household water-leak alerts, average household water use fell by 10% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument gives the result before stating the recommendation.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument generalizes from one case to every case without enough support.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 25

Level 1

In a memo about body-camera activation reminders, Riley writes, "During a small trial of sending body-camera activation reminders before patrol shifts, missing-camera-footage reports fell by 35% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. A before-and-after change is used as proof of cause without more evidence.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 26

Level 1

Maya says, "Most mail voters asked in a survey liked offering online mail-ballot tracking. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The argument uses ordinary language rather than technical terms.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** Most survey approval is used as proof that every affected person will be helped.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 27

Level 1

A report says the average result improved after sending spaced-review prompts for language vocabulary. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The group average is assumed to show what happened to each individual person.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 28

Level 1

At a planning meeting about a beginner gym orientation, Avery says, "In one group that tried offering a beginner gym orientation, new-member cancellations fell by 19% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** One successful example is used as if it proves the result will happen everywhere.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 29

Level 1

In a memo about safe-driving feedback for policyholders, Taylor writes, "During a small trial of sending weekly safe-driving feedback, reported minor crashes fell by 8% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The action is assumed to be the cause just because the change came after it.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 30

Level 1

Morgan says, "Most newsletter readers asked in a survey liked placing corrections at the top of articles. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. Liking the plan is treated as proof that the plan benefits every person affected.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 31

Level 1

A report says the average result improved after requiring clearer price signs at vendor stalls. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The reasoning stretches an average improvement into the claim that everyone improved.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 32

Level 1

At a planning meeting about hotel quiet-hours text reminders, Jordan says, "In one group that tried sending quiet-hours text reminders to hotel guests, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. One group improved, but that does not show all similar settings will improve too.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

Maya says, "Most late-shift workers asked in a survey liked extending evening bus service until midnight. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The argument uses ordinary language rather than technical terms.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** Most survey approval is used as proof that every affected person will be helped.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 34

Level 2

A report says the average result improved after requiring phone lockers during class. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The group average is assumed to show what happened to each individual person.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 35

Level 2

At a planning meeting about medication reminder texts for older patients, Avery says, "In one group that tried sending medication reminder texts before evening doses, missed-dose reports fell by 18% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** One successful example is used as if it proves the result will happen everywhere.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 36

Level 2

In a memo about a four-day workweek test for software engineers, Taylor writes, "During a small trial of testing a Monday-through-Thursday workweek, staff resignations fell by 15% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 37

Level 2

Morgan says, "Most weekly grocery shoppers asked in a survey liked adding larger unit-price labels on shelf tags. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** Liking the plan is treated as proof that the plan benefits every person affected.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 38

Level 2

A report says the average result improved after waiving late fines for children's books. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The reasoning stretches an average improvement into the claim that everyone improved.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 39

Level 2

At a planning meeting about two-factor login for site administrators, Jordan says, "In one group that tried requiring two-factor login for site administrators, admin account takeovers fell by 44% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** One group improved, but that does not show all similar settings will improve too.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 40

Level 2

In a memo about brighter streetlights on Maple Street, Riley writes, "During a small trial of adding brighter LED streetlights on Maple Street, reported thefts fell by 12% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The action is assumed to be the cause just because the change came after it.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 41

Level 2

Maya says, "Most first-year statistics students asked in a survey liked expanding peer tutoring in statistics. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** A survey of most people is assumed to show that every person will benefit.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 42

Level 2

A report says the average result improved after showing calorie labels on printed lunch menus. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. A group-level result is read as if it proves the same result for every person.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 43

Level 2

At a planning meeting about bank overdraft warning texts, Avery says, "In one group that tried sending overdraft warning texts before fees post, overdraft fees fell by 24% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. One test is assumed to be enough to show the plan will work in every setting.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 44

Level 2

In a memo about timed-entry passes for weekend park trails, Taylor writes, "During a small trial of using timed-entry passes for weekend trail visits, trail crowding complaints fell by 33% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The reasoning moves from sequence to cause without checking what else changed.
C. The memo uses a small trial, which may still provide a clue worth checking.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 45

Level 2

Morgan says, "Most local families asked in a survey liked offering free admission on Fridays. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. People liking the plan is confused with evidence that the plan helps everyone.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 46

Level 2

A report says the average result improved after adding mandatory sideline concussion checks. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** Some people may not improve even when the average does, and the argument misses that.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 47

Level 2

At a planning meeting about same-day donation receipts, Jordan says, "In one group that tried sending donation receipts within one day, donor retention rose by 14% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. A single success becomes a much broader claim than the evidence supports.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 48

Level 2

In a memo about warehouse ergonomic training, Riley writes, "During a small trial of offering monthly lifting-safety and ergonomic training, back-injury claims fell by 20% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** Timing is counted as enough evidence even though another cause could explain the result.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 49

Level 2

Maya says, "Most apartment residents asked in a survey liked placing compost bins in apartment lobbies. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim moves from what most surveyed people liked to what everyone will benefit from.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 50

Level 2

A report says the average result improved after making new user profiles private by default. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The average change is used as proof that every individual changed the same way.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 51

Level 2

At a planning meeting about same-day clinic appointment slots, Avery says, "In one group that tried reserving same-day appointment slots, patient no-show rates fell by 13% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument generalizes from one case to every case without enough support.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument gives the result before stating the recommendation.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 52

Level 2

In a memo about seat-zone airline boarding, Taylor writes, "During a small trial of boarding passengers by seat zone, average boarding time fell by 9% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** Timing alone is treated as proof of causation, without ruling out other causes.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 53

Level 2

Morgan says, "Most apartment tenants asked in a survey liked launching an online apartment repair portal. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** Most survey approval is used as proof that every affected person will be helped.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 54

Level 2

A report says the average result improved after moving fruit bowls to the front of the cafeteria line. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The group average is assumed to show what happened to each individual person.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 55

Level 2

At a planning meeting about weekly call-center script coaching, Jordan says, "In one group that tried giving support agents weekly script coaching, customer complaint rates fell by 18% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** One successful example is used as if it proves the result will happen everywhere.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 56

Level 2

In a memo about household water-leak alerts, Riley writes, "During a small trial of sending automatic household water-leak alerts, average household water use fell by 10% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 57

Level 2

Maya says, "Most patrol officers asked in a survey liked sending body-camera activation reminders before patrol shifts. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** Liking the plan is treated as proof that the plan benefits every person affected.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 58

Level 2

A report says the average result improved after offering online mail-ballot tracking. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The reasoning stretches an average improvement into the claim that everyone improved.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 59

Level 2

At a planning meeting about language-learning spaced-review prompts, Avery says, "In one group that tried sending spaced-review prompts for language vocabulary, vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** One group improved, but that does not show all similar settings will improve too.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 60

Level 2

In a memo about a beginner gym orientation, Taylor writes, "During a small trial of offering a beginner gym orientation, new-member cancellations fell by 19% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The action is assumed to be the cause just because the change came after it.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 61

Level 2

Morgan says, "Most auto-insurance policyholders asked in a survey liked sending weekly safe-driving feedback. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The argument uses ordinary language rather than technical terms.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** A survey of most people is assumed to show that every person will benefit.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 62

Level 2

A report says the average result improved after placing corrections at the top of articles. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. A group-level result is read as if it proves the same result for every person.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 63

Level 2

At a planning meeting about clearer farmers market price signs, Jordan says, "In one group that tried requiring clearer price signs at vendor stalls, price disputes fell by 28% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. One test is assumed to be enough to show the plan will work in every setting.	**B.** The argument uses one example, which can be a helpful starting point for discussion.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument gives the result before stating the recommendation.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 64

Level 2

In a memo about hotel quiet-hours text reminders, Riley writes, "During a small trial of sending quiet-hours text reminders to hotel guests, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The reasoning moves from sequence to cause without checking what else changed.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

A report says the average result improved after extending evening bus service until midnight. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The reasoning stretches an average improvement into the claim that everyone improved.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 66

Level 3

At a planning meeting about classroom phone lockers, Avery says, "In one group that tried requiring phone lockers during class, classroom disruption reports fell by 31% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. One group improved, but that does not show all similar settings will improve too.	**B.** The argument uses one example, which can be a helpful starting point for discussion.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 67

Level 3

In a memo about medication reminder texts for older patients, Taylor writes, "During a small trial of sending medication reminder texts before evening doses, missed-dose reports fell by 18% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The action is assumed to be the cause just because the change came after it.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 68

Level 3

Morgan says, "Most software engineers asked in a survey liked testing a Monday-through-Thursday workweek. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. Liking the plan is treated as proof that the plan benefits every person affected.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The argument uses ordinary language rather than technical terms.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 69

Level 3

A report says the average result improved after adding larger unit-price labels on shelf tags. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. A group-level result is read as if it proves the same result for every person.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 70

Level 3

At a planning meeting about late fines on children's books, Jordan says, "In one group that tried waiving late fines for children's books, library card renewals rose by 19% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. One test is assumed to be enough to show the plan will work in every setting.	**D.** The argument gives the result before stating the recommendation.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 71

Level 3

In a memo about two-factor login for site administrators, Riley writes, "During a small trial of requiring two-factor login for site administrators, admin account takeovers fell by 44% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The reasoning moves from sequence to cause without checking what else changed.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 72

Level 3

Maya says, "Most residents on Maple Street asked in a survey liked adding brighter LED streetlights on Maple Street. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. A survey of most people is assumed to show that every person will benefit.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 73

Level 3

A report says the average result improved after expanding peer tutoring in statistics. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 74

Level 3

At a planning meeting about calorie labels on restaurant menus, Avery says, "In one group that tried showing calorie labels on printed lunch menus, dessert orders fell by 16% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument gives the result before stating the recommendation.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 75

Level 3

In a memo about bank overdraft warning texts, Taylor writes, "During a small trial of sending overdraft warning texts before fees post, overdraft fees fell by 24% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** Timing is counted as enough evidence even though another cause could explain the result.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 76

Level 3

Morgan says, "Most weekend trail hikers asked in a survey liked using timed-entry passes for weekend trail visits. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. People liking the plan is confused with evidence that the plan helps everyone.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 77

Level 3

A report says the average result improved after offering free admission on Fridays. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The average change is used as proof that every individual changed the same way.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 78

Level 3

At a planning meeting about youth soccer concussion checks, Jordan says, "In one group that tried adding mandatory sideline concussion checks, repeat head injuries fell by 21% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument generalizes from one case to every case without enough support.	**D.** The argument gives the result before stating the recommendation.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 79

Level 3

In a memo about same-day donation receipts, Riley writes, "During a small trial of sending donation receipts within one day, donor retention rose by 14% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** Timing alone is treated as proof of causation, without ruling out other causes.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 80

Level 3

Maya says, "Most warehouse staff asked in a survey liked offering monthly lifting-safety and ergonomic training. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim moves from what most surveyed people liked to what everyone will benefit from.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The argument uses ordinary language rather than technical terms.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 81

Level 3

A report says the average result improved after placing compost bins in apartment lobbies. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The group average is assumed to show what happened to each individual person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 82

Level 3

At a planning meeting about private-by-default app profiles, Avery says, "In one group that tried making new user profiles private by default, publicly visible profiles fell by 48% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. One successful example is used as if it proves the result will happen everywhere.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 83

Level 3

In a memo about same-day clinic appointment slots, Taylor writes, "During a small trial of reserving same-day appointment slots, patient no-show rates fell by 13% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The memo uses a small trial, which may still provide a clue worth checking.	**D.** A before-and-after change is used as proof of cause without more evidence.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 84

Level 3

Morgan says, "Most domestic flight passengers asked in a survey liked boarding passengers by seat zone. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. Most survey approval is used as proof that every affected person will be helped.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 85

Level 3

A report says the average result improved after launching an online apartment repair portal. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The reasoning stretches an average improvement into the claim that everyone improved.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 86

Level 3

At a planning meeting about fruit placement in a school cafeteria line, Jordan says, "In one group that tried moving fruit bowls to the front of the cafeteria line, fruit purchases rose by 23% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** One group improved, but that does not show all similar settings will improve too.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 87

Level 3

In a memo about weekly call-center script coaching, Riley writes, "During a small trial of giving support agents weekly script coaching, customer complaint rates fell by 18% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The action is assumed to be the cause just because the change came after it.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 88

Level 3

Maya says, "Most local homeowners asked in a survey liked sending automatic household water-leak alerts. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** Liking the plan is treated as proof that the plan benefits every person affected.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 89

Level 3

A report says the average result improved after sending body-camera activation reminders before patrol shifts. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** A group-level result is read as if it proves the same result for every person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 90

Level 3

At a planning meeting about county mail-ballot tracking, Avery says, "In one group that tried offering online mail-ballot tracking, phone calls asking ballot status fell by 42% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** One test is assumed to be enough to show the plan will work in every setting.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 91

Level 3

In a memo about language-learning spaced-review prompts, Taylor writes, "During a small trial of sending spaced-review prompts for language vocabulary, vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The reasoning moves from sequence to cause without checking what else changed.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The memo uses a small trial, which may still provide a clue worth checking.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 92

Level 3

Morgan says, "Most new gym members asked in a survey liked offering a beginner gym orientation. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** A survey of most people is assumed to show that every person will benefit.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 93

Level 3

A report says the average result improved after sending weekly safe-driving feedback. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** Some people may not improve even when the average does, and the argument misses that.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 94

Level 3

At a planning meeting about top-of-article correction boxes, Jordan says, "In one group that tried placing corrections at the top of articles, reader trust ratings rose by 7% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** A single success becomes a much broader claim than the evidence supports.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 95

Level 3

In a memo about clearer farmers market price signs, Riley writes, "During a small trial of requiring clearer price signs at vendor stalls, price disputes fell by 28% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** Timing is counted as enough evidence even though another cause could explain the result.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: B. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 96

Level 3

Maya says, "Most overnight hotel guests asked in a survey liked sending quiet-hours text reminders to hotel guests. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. People liking the plan is confused with evidence that the plan helps everyone.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

At a planning meeting about evening bus service for late-shift workers, Avery says, "In one group that tried extending evening bus service until midnight, late-shift commute complaints fell by 22% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument gives the result before stating the recommendation.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** One test is assumed to be enough to show the plan will work in every setting.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 98

Level 4

In a memo about classroom phone lockers, Taylor writes, "During a small trial of requiring phone lockers during class, classroom disruption reports fell by 31% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The reasoning moves from sequence to cause without checking what else changed.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 99

Level 4

Morgan says, "Most patients over 60 asked in a survey liked sending medication reminder texts before evening doses. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** A survey of most people is assumed to show that every person will benefit.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 100

Level 4

A report says the average result improved after testing a Monday-through-Thursday workweek. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. A group-level result is read as if it proves the same result for every person.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 101

Level 4

At a planning meeting about larger grocery unit-price labels, Jordan says, "In one group that tried adding larger unit-price labels on shelf tags, shopper overpayment complaints fell by 27% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument gives the result before stating the recommendation.	**D.** A single success becomes a much broader claim than the evidence supports.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 102

Level 4

In a memo about late fines on children's books, Riley writes, "During a small trial of waiving late fines for children's books, library card renewals rose by 19% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 103

Level 4

Maya says, "Most site administrators asked in a survey liked requiring two-factor login for site administrators. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** People liking the plan is confused with evidence that the plan helps everyone.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 104

Level 4

A report says the average result improved after adding brighter LED streetlights on Maple Street. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 105

Level 4

At a planning meeting about peer tutoring for first-year statistics students, Avery says, "In one group that tried expanding peer tutoring in statistics, course pass rates rose by 11% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument generalizes from one case to every case without enough support.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 106

Level 4

In a memo about calorie labels on restaurant menus, Taylor writes, "During a small trial of showing calorie labels on printed lunch menus, dessert orders fell by 16% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The memo uses a small trial, which may still provide a clue worth checking.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 107

Level 4

Morgan says, "Most checking-account customers asked in a survey liked sending overdraft warning texts before fees post. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim moves from what most surveyed people liked to what everyone will benefit from.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 108

Level 4

A report says the average result improved after using timed-entry passes for weekend trail visits. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The average change is used as proof that every individual changed the same way.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 109

Level 4

At a planning meeting about free Friday museum admission, Jordan says, "In one group that tried offering free admission on Fridays, family visits rose by 29% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** The argument gives the result before stating the recommendation.
C. One successful example is used as if it proves the result will happen everywhere.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 110

Level 4

In a memo about youth soccer concussion checks, Riley writes, "During a small trial of adding mandatory sideline concussion checks, repeat head injuries fell by 21% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** A before-and-after change is used as proof of cause without more evidence.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 111

Level 4

Maya says, "Most first-time donors asked in a survey liked sending donation receipts within one day. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. Most survey approval is used as proof that every affected person will be helped.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 112

Level 4

A report says the average result improved after offering monthly lifting-safety and ergonomic training. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** The group average is assumed to show what happened to each individual person.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 113

Level 4

At a planning meeting about apartment-lobby compost bins, Avery says, "In one group that tried placing compost bins in apartment lobbies, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument uses one example, which can be a helpful starting point for discussion.
C. One group improved, but that does not show all similar settings will improve too.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 114

Level 4

In a memo about private-by-default app profiles, Taylor writes, "During a small trial of making new user profiles private by default, publicly visible profiles fell by 48% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The action is assumed to be the cause just because the change came after it.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 115

Level 4

Morgan says, "Most primary-care patients asked in a survey liked reserving same-day appointment slots. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. Liking the plan is treated as proof that the plan benefits every person affected.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 116

Level 4

A report says the average result improved after boarding passengers by seat zone. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The reasoning stretches an average improvement into the claim that everyone improved.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 117

Level 4

At a planning meeting about an online apartment repair portal, Jordan says, "In one group that tried launching an online apartment repair portal, unresolved repair requests fell by 26% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** One test is assumed to be enough to show the plan will work in every setting.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 118

Level 4

In a memo about fruit placement in a school cafeteria line, Riley writes, "During a small trial of moving fruit bowls to the front of the cafeteria line, fruit purchases rose by 23% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The reasoning moves from sequence to cause without checking what else changed.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 119

Level 4

Maya says, "Most support agents asked in a survey liked giving support agents weekly script coaching. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** A survey of most people is assumed to show that every person will benefit.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 120

Level 4

A report says the average result improved after sending automatic household water-leak alerts. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. A group-level result is read as if it proves the same result for every person.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 121

Level 4

At a planning meeting about body-camera activation reminders, Avery says, "In one group that tried sending body-camera activation reminders before patrol shifts, missing-camera-footage reports fell by 35% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** A single success becomes a much broader claim than the evidence supports.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 122

Level 4

In a memo about county mail-ballot tracking, Taylor writes, "During a small trial of offering online mail-ballot tracking, phone calls asking ballot status fell by 42% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 123

Level 4

Morgan says, "Most language learners asked in a survey liked sending spaced-review prompts for language vocabulary. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. People liking the plan is confused with evidence that the plan helps everyone.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 124

Level 4

A report says the average result improved after offering a beginner gym orientation. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. Some people may not improve even when the average does, and the argument misses that.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 125

Level 4

At a planning meeting about safe-driving feedback for policyholders, Jordan says, "In one group that tried sending weekly safe-driving feedback, reported minor crashes fell by 8% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument generalizes from one case to every case without enough support.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 126

Level 4

In a memo about top-of-article correction boxes, Riley writes, "During a small trial of placing corrections at the top of articles, reader trust ratings rose by 7% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 127

Level 4

Maya says, "Most weekend farmers market shoppers asked in a survey liked requiring clearer price signs at vendor stalls. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The argument uses ordinary language rather than technical terms.	**D.** The claim moves from what most surveyed people liked to what everyone will benefit from.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 128

Level 4

A report says the average result improved after sending quiet-hours text reminders to hotel guests. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The average change is used as proof that every individual changed the same way.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

In a memo about evening bus service for late-shift workers, Taylor writes, "During a small trial of extending evening bus service until midnight, late-shift commute complaints fell by 22% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 130

Level 5

Morgan says, "Most ninth-grade students asked in a survey liked requiring phone lockers during class. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** People liking the plan is confused with evidence that the plan helps everyone.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 131

Level 5

A report says the average result improved after sending medication reminder texts before evening doses. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 132

Level 5

At a planning meeting about a four-day workweek test for software engineers, Jordan says, "In one group that tried testing a Monday-through-Thursday workweek, staff resignations fell by 15% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 133

Level 5

In a memo about larger grocery unit-price labels, Riley writes, "During a small trial of adding larger unit-price labels on shelf tags, shopper overpayment complaints fell by 27% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. Timing alone is treated as proof of causation, without ruling out other causes.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 134

Level 5

Maya says, "Most families checking out children's books asked in a survey liked waiving late fines for children's books. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The claim moves from what most surveyed people liked to what everyone will benefit from.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 135

Level 5

A report says the average result improved after requiring two-factor login for site administrators. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The average change is used as proof that every individual changed the same way.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 136

Level 5

At a planning meeting about brighter streetlights on Maple Street, Avery says, "In one group that tried adding brighter LED streetlights on Maple Street, reported thefts fell by 12% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument generalizes from one case to every case without enough support.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 137

Level 5

In a memo about peer tutoring for first-year statistics students, Taylor writes, "During a small trial of expanding peer tutoring in statistics, course pass rates rose by 11% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 138

Level 5

Morgan says, "Most lunch customers asked in a survey liked showing calorie labels on printed lunch menus. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** Most survey approval is used as proof that every affected person will be helped.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 139

Level 5

A report says the average result improved after sending overdraft warning texts before fees post. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The group average is assumed to show what happened to each individual person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 140

Level 5

At a planning meeting about timed-entry passes for weekend park trails, Jordan says, "In one group that tried using timed-entry passes for weekend trail visits, trail crowding complaints fell by 33% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** One successful example is used as if it proves the result will happen everywhere.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 141

Level 5

In a memo about free Friday museum admission, Riley writes, "During a small trial of offering free admission on Fridays, family visits rose by 29% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The action is assumed to be the cause just because the change came after it.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 142

Level 5

Maya says, "Most youth soccer players asked in a survey liked adding mandatory sideline concussion checks. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. Liking the plan is treated as proof that the plan benefits every person affected.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 143

Level 5

A report says the average result improved after sending donation receipts within one day. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The reasoning stretches an average improvement into the claim that everyone improved.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 144

Level 5

At a planning meeting about warehouse ergonomic training, Avery says, "In one group that tried offering monthly lifting-safety and ergonomic training, back-injury claims fell by 20% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** One group improved, but that does not show all similar settings will improve too.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 145

Level 5

In a memo about apartment-lobby compost bins, Taylor writes, "During a small trial of placing compost bins in apartment lobbies, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The reasoning moves from sequence to cause without checking what else changed.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 146

Level 5

Morgan says, "Most new app users asked in a survey liked making new user profiles private by default. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** A survey of most people is assumed to show that every person will benefit.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The argument uses ordinary language rather than technical terms.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 147

Level 5

A report says the average result improved after reserving same-day appointment slots. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** A group-level result is read as if it proves the same result for every person.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 148

Level 5

At a planning meeting about seat-zone airline boarding, Jordan says, "In one group that tried boarding passengers by seat zone, average boarding time fell by 9% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. One test is assumed to be enough to show the plan will work in every setting.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 149

Level 5

In a memo about an online apartment repair portal, Riley writes, "During a small trial of launching an online apartment repair portal, unresolved repair requests fell by 26% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 150

Level 5

Maya says, "Most middle-school students asked in a survey liked moving fruit bowls to the front of the cafeteria line. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** People liking the plan is confused with evidence that the plan helps everyone.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 151

Level 5

A report says the average result improved after giving support agents weekly script coaching. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 152

Level 5

At a planning meeting about household water-leak alerts, Avery says, "In one group that tried sending automatic household water-leak alerts, average household water use fell by 10% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 153

Level 5

In a memo about body-camera activation reminders, Taylor writes, "During a small trial of sending body-camera activation reminders before patrol shifts, missing-camera-footage reports fell by 35% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 154

Level 5

Morgan says, "Most mail voters asked in a survey liked offering online mail-ballot tracking. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim moves from what most surveyed people liked to what everyone will benefit from.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 155

Level 5

A report says the average result improved after sending spaced-review prompts for language vocabulary. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The average change is used as proof that every individual changed the same way.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 156

Level 5

At a planning meeting about a beginner gym orientation, Jordan says, "In one group that tried offering a beginner gym orientation, new-member cancellations fell by 19% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument generalizes from one case to every case without enough support.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 157

Level 5

In a memo about safe-driving feedback for policyholders, Riley writes, "During a small trial of sending weekly safe-driving feedback, reported minor crashes fell by 8% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 158

Level 5

Maya says, "Most newsletter readers asked in a survey liked placing corrections at the top of articles. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. Most survey approval is used as proof that every affected person will be helped.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 159

Level 5

A report says the average result improved after requiring clearer price signs at vendor stalls. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The group average is assumed to show what happened to each individual person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 160

Level 5

At a planning meeting about hotel quiet-hours text reminders, Avery says, "In one group that tried sending quiet-hours text reminders to hotel guests, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. One successful example is used as if it proves the result will happen everywhere.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.
