D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 115

Level 4

Morgan says, "Most primary-care patients asked in a survey liked reserving same-day appointment slots. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. Liking the plan is treated as proof that the plan benefits every person affected.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 116

Level 4

A report says the average result improved after boarding passengers by seat zone. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The reasoning stretches an average improvement into the claim that everyone improved.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 117

Level 4

At a planning meeting about an online apartment repair portal, Jordan says, "In one group that tried launching an online apartment repair portal, unresolved repair requests fell by 26% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** One test is assumed to be enough to show the plan will work in every setting.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 118

Level 4

In a memo about fruit placement in a school cafeteria line, Riley writes, "During a small trial of moving fruit bowls to the front of the cafeteria line, fruit purchases rose by 23% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The reasoning moves from sequence to cause without checking what else changed.	**D.** The argument names the action clearly, so the main problem is not unclear wording.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 119

Level 4

Maya says, "Most support agents asked in a survey liked giving support agents weekly script coaching. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** A survey of most people is assumed to show that every person will benefit.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 120

Level 4

A report says the average result improved after sending automatic household water-leak alerts. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. A group-level result is read as if it proves the same result for every person.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 121

Level 4

At a planning meeting about body-camera activation reminders, Avery says, "In one group that tried sending body-camera activation reminders before patrol shifts, missing-camera-footage reports fell by 35% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** A single success becomes a much broader claim than the evidence supports.

Answer: D. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 122

Level 4

In a memo about county mail-ballot tracking, Taylor writes, "During a small trial of offering online mail-ballot tracking, phone calls asking ballot status fell by 42% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 123

Level 4

Morgan says, "Most language learners asked in a survey liked sending spaced-review prompts for language vocabulary. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. People liking the plan is confused with evidence that the plan helps everyone.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The argument uses ordinary language rather than technical terms.

Answer: A. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 124

Level 4

A report says the average result improved after offering a beginner gym orientation. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. Some people may not improve even when the average does, and the argument misses that.	**D.** The argument talks about a group, so individual stories may still be relevant later.

Answer: C. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 125

Level 4

At a planning meeting about safe-driving feedback for policyholders, Jordan says, "In one group that tried sending weekly safe-driving feedback, reported minor crashes fell by 8% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument generalizes from one case to every case without enough support.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 126

Level 4

In a memo about top-of-article correction boxes, Riley writes, "During a small trial of placing corrections at the top of articles, reader trust ratings rose by 7% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The evidence comes before the conclusion, which is a normal way to present an argument.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 127

Level 4

Maya says, "Most weekend farmers market shoppers asked in a survey liked requiring clearer price signs at vendor stalls. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The argument uses ordinary language rather than technical terms.	**D.** The claim moves from what most surveyed people liked to what everyone will benefit from.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 128

Level 4

A report says the average result improved after sending quiet-hours text reminders to hotel guests. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The average change is used as proof that every individual changed the same way.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

In a memo about evening bus service for late-shift workers, Taylor writes, "During a small trial of extending evening bus service until midnight, late-shift commute complaints fell by 22% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 130

Level 5

Morgan says, "Most ninth-grade students asked in a survey liked requiring phone lockers during class. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** People liking the plan is confused with evidence that the plan helps everyone.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 131

Level 5

A report says the average result improved after sending medication reminder texts before evening doses. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 132

Level 5

At a planning meeting about a four-day workweek test for software engineers, Jordan says, "In one group that tried testing a Monday-through-Thursday workweek, staff resignations fell by 15% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 133

Level 5

In a memo about larger grocery unit-price labels, Riley writes, "During a small trial of adding larger unit-price labels on shelf tags, shopper overpayment complaints fell by 27% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. Timing alone is treated as proof of causation, without ruling out other causes.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 134

Level 5

Maya says, "Most families checking out children's books asked in a survey liked waiving late fines for children's books. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. The claim talks about benefit, so the next step would be to define what benefit means.	**D.** The claim moves from what most surveyed people liked to what everyone will benefit from.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 135

Level 5

A report says the average result improved after requiring two-factor login for site administrators. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The average change is used as proof that every individual changed the same way.	**B.** The conclusion comes after the report's result, which is not automatically a mistake.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The report uses an average, which can be a useful summary when read carefully.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 136

Level 5

At a planning meeting about brighter streetlights on Maple Street, Avery says, "In one group that tried adding brighter LED streetlights on Maple Street, reported thefts fell by 12% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument generalizes from one case to every case without enough support.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 137

Level 5

In a memo about peer tutoring for first-year statistics students, Taylor writes, "During a small trial of expanding peer tutoring in statistics, course pass rates rose by 11% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 138

Level 5

Morgan says, "Most lunch customers asked in a survey liked showing calorie labels on printed lunch menus. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** Most survey approval is used as proof that every affected person will be helped.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 139

Level 5

A report says the average result improved after sending overdraft warning texts before fees post. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The group average is assumed to show what happened to each individual person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 140

Level 5

At a planning meeting about timed-entry passes for weekend park trails, Jordan says, "In one group that tried using timed-entry passes for weekend trail visits, trail crowding complaints fell by 33% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** One successful example is used as if it proves the result will happen everywhere.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 141

Level 5

In a memo about free Friday museum admission, Riley writes, "During a small trial of offering free admission on Fridays, family visits rose by 29% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The memo uses a small trial, which may still provide a clue worth checking.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The action is assumed to be the cause just because the change came after it.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 142

Level 5

Maya says, "Most youth soccer players asked in a survey liked adding mandatory sideline concussion checks. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The survey gives people a chance to react to the idea, which can be useful background.	**B.** The argument uses ordinary language rather than technical terms.
C. Liking the plan is treated as proof that the plan benefits every person affected.	**D.** The claim talks about benefit, so the next step would be to define what benefit means.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 143

Level 5

A report says the average result improved after sending donation receipts within one day. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The conclusion comes after the report's result, which is not automatically a mistake.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The reasoning stretches an average improvement into the claim that everyone improved.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 144

Level 5

At a planning meeting about warehouse ergonomic training, Avery says, "In one group that tried offering monthly lifting-safety and ergonomic training, back-injury claims fell by 20% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument uses one example, which can be a helpful starting point for discussion.	**B.** One group improved, but that does not show all similar settings will improve too.
C. The argument gives the result before stating the recommendation.	**D.** The argument mentions a measured change, so the number should be checked carefully.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 145

Level 5

In a memo about apartment-lobby compost bins, Taylor writes, "During a small trial of placing compost bins in apartment lobbies, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. The argument names the action clearly, so the main problem is not unclear wording.	**B.** The memo uses a small trial, which may still provide a clue worth checking.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The reasoning moves from sequence to cause without checking what else changed.

Answer: D. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 146

Level 5

Morgan says, "Most new app users asked in a survey liked making new user profiles private by default. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** A survey of most people is assumed to show that every person will benefit.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** The argument uses ordinary language rather than technical terms.

Answer: B. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 147

Level 5

A report says the average result improved after reserving same-day appointment slots. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The report uses an average, which can be a useful summary when read carefully.	**B.** A group-level result is read as if it proves the same result for every person.
C. The argument talks about a group, so individual stories may still be relevant later.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: B. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 148

Level 5

At a planning meeting about seat-zone airline boarding, Jordan says, "In one group that tried boarding passengers by seat zone, average boarding time fell by 9% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. One test is assumed to be enough to show the plan will work in every setting.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. The argument uses one example, which can be a helpful starting point for discussion.	**D.** The argument gives the result before stating the recommendation.

Answer: A. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 149

Level 5

In a memo about an online apartment repair portal, Riley writes, "During a small trial of launching an online apartment repair portal, unresolved repair requests fell by 26% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. The evidence comes before the conclusion, which is a normal way to present an argument.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. Timing is counted as enough evidence even though another cause could explain the result.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: C. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 150

Level 5

Maya says, "Most middle-school students asked in a survey liked moving fruit bowls to the front of the cafeteria line. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. The survey gives people a chance to react to the idea, which can be useful background.	**D.** People liking the plan is confused with evidence that the plan helps everyone.

Answer: D. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 151

Level 5

A report says the average result improved after giving support agents weekly script coaching. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. Some people may not improve even when the average does, and the argument misses that.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 152

Level 5

At a planning meeting about household water-leak alerts, Avery says, "In one group that tried sending automatic household water-leak alerts, average household water use fell by 10% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** A single success becomes a much broader claim than the evidence supports.
C. The argument mentions a measured change, so the number should be checked carefully.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: B. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is B because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 153

Level 5

In a memo about body-camera activation reminders, Taylor writes, "During a small trial of sending body-camera activation reminders before patrol shifts, missing-camera-footage reports fell by 35% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Taylor's reasoning?

A. Timing alone is treated as proof of causation, without ruling out other causes.	**B.** The evidence comes before the conclusion, which is a normal way to present an argument.
C. The argument names the action clearly, so the main problem is not unclear wording.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 154

Level 5

Morgan says, "Most mail voters asked in a survey liked offering online mail-ballot tracking. So every person affected will benefit from it." What is the logical gap in Morgan's reasoning?

A. The claim talks about benefit, so the next step would be to define what benefit means.	**B.** The survey gives people a chance to react to the idea, which can be useful background.
C. The claim moves from what most surveyed people liked to what everyone will benefit from.	**D.** The argument uses ordinary language rather than technical terms.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 155

Level 5

A report says the average result improved after sending spaced-review prompts for language vocabulary. Casey concludes, "That means every person in the group improved." What is the logical gap in Casey's reasoning?

A. The average change is used as proof that every individual changed the same way.	**B.** The argument talks about a group, so individual stories may still be relevant later.
C. The report uses an average, which can be a useful summary when read carefully.	**D.** The conclusion comes after the report's result, which is not automatically a mistake.

Answer: A. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

Question 156

Level 5

At a planning meeting about a beginner gym orientation, Jordan says, "In one group that tried offering a beginner gym orientation, new-member cancellations fell by 19% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Jordan's reasoning?

A. The argument mentions a measured change, so the number should be checked carefully.	**B.** The argument gives the result before stating the recommendation.
C. The argument generalizes from one case to every case without enough support.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Question 157

Level 5

In a memo about safe-driving feedback for policyholders, Riley writes, "During a small trial of sending weekly safe-driving feedback, reported minor crashes fell by 8% compared with the four weeks before the test. So the action caused the change." What is the logical gap in Riley's reasoning?

A. A before-and-after change is used as proof of cause without more evidence.	**B.** The argument names the action clearly, so the main problem is not unclear wording.
C. The evidence comes before the conclusion, which is a normal way to present an argument.	**D.** The memo uses a small trial, which may still provide a clue worth checking.

Answer: A. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is A because it names the jump the argument makes.

A. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

B. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

C. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

D. Not correct. This does not identify the inference problem. The logical gap is treating timing as proof of cause. Something happening first does not, by itself, prove it caused what came next.

Question 158

Level 5

Maya says, "Most newsletter readers asked in a survey liked placing corrections at the top of articles. So every person affected will benefit from it." What is the logical gap in Maya's reasoning?

A. The argument uses ordinary language rather than technical terms.	**B.** The claim talks about benefit, so the next step would be to define what benefit means.
C. Most survey approval is used as proof that every affected person will be helped.	**D.** The survey gives people a chance to react to the idea, which can be useful background.

Answer: C. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

B. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

D. Not correct. This does not identify the inference problem. The logical gap is moving from most surveyed people to every affected person. Liking a plan also does not prove the plan helps.

Question 159

Level 5

A report says the average result improved after requiring clearer price signs at vendor stalls. Sam concludes, "That means every person in the group improved." What is the logical gap in Sam's reasoning?

A. The argument talks about a group, so individual stories may still be relevant later.	**B.** The report uses an average, which can be a useful summary when read carefully.
C. The conclusion comes after the report's result, which is not automatically a mistake.	**D.** The group average is assumed to show what happened to each individual person.

Answer: D. The logical gap is that an average can go up even when some people do not improve.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is D because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

B. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

C. Not correct. This does not identify the inference problem. The logical gap is that an average can go up even when some people do not improve.

D. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is that an average can go up even when some people do not improve.

Question 160

Level 5

At a planning meeting about hotel quiet-hours text reminders, Avery says, "In one group that tried sending quiet-hours text reminders to hotel guests, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. So this plan will work in every similar setting." What is the logical gap in Avery's reasoning?

A. The argument gives the result before stating the recommendation.	**B.** The argument mentions a measured change, so the number should be checked carefully.
C. One successful example is used as if it proves the result will happen everywhere.	**D.** The argument uses one example, which can be a helpful starting point for discussion.

Answer: C. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

How to work it out. To uncover the answer, state exactly what the evidence shows, then compare it with what the conclusion adds. The correct choice is C because it names the jump the argument makes.

A. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

B. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

C. Correct. This names the step in the reasoning that does not follow from the evidence. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

D. Not correct. This does not identify the inference problem. The logical gap is the jump from one case to every case. One success does not prove the same thing will happen everywhere.

Skill 09

Recognize Common Fallacies

What's the Fallacy?

Match a bad argument to its mistake. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	What recognizable bad move does this argument make?
Why it matters	Fallacy labels are useful when they name a precise pattern, not when they are used as insults. The goal is to diagnose the bad move so the discussion can return to the actual issue.
Conceptual core	Fallacy work should improve reasoning, not turn discussion into name-calling. Students should first describe the move in plain language, then attach the label. The label is useful only if it identifies the structure: attacking a person instead of the argument, pretending there are only two options, misrepresenting an opponent, changing the subject, appealing to popularity, or assuming the conclusion.
Student method	Identify the move made by the speaker: attacking the person, reducing options to two, changing the subject, exaggerating an opponent, treating popularity as proof, or assuming what needs proof.
Analogy	A fallacy is a recognizable wrong turn in reasoning. The label is the road sign, but the real skill is seeing the turn.
Assessment focus	A good answer selects the fallacy whose structure matches the scenario and rejects labels that are only topically related.
Resource note	The quiz feedback links fallacy items to corresponding LogFall articles when a direct article match is available.

Teaching Sequence

1. Describe what the speaker does in ordinary language.

2. Match that move to the fallacy label.

3. Use the wrong choices as contrast cases rather than memorized vocabulary.

4. Explain how the argument could return to the real issue.

Common Confusions To Watch For

1. Students may label any bad argument with a familiar fallacy name.

2. Students may confuse a harsh tone with ad hominem when the evidence is still addressed.

3. Students may spot the topic but miss the argumentative move.

Teacher Prompts

1. What move did the speaker make?

2. Did the reply address the claim or dodge it?

3. How would you describe the error without using a fallacy label?

Worked Example

Scenario	A student asks whether a new schedule has evidence behind it. Another student replies, you just hate change and want the school to fail.
Teacher think-aloud	The reply attacks the person's attitude instead of answering the evidence question. That is an ad hominem style move, not a response to the argument.
Student takeaway	Name the pattern only after you can describe the bad reasoning move.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. Maya asks, 'What evidence shows the new timetable improves attendance?' Lee replies, 'You just hate change and want our school to fail.' No attendance results have been supplied.

What To Do

1. State Maya's question in your own words.

2. Explain what Lee discusses instead and why that does not answer the question.

3. Rewrite Lee's reply in two sentences: acknowledge the missing evidence and propose a relevant comparison. Do not invent a successful result.

Check before reading the answer. Have you addressed attendance rather than guessed Maya's motives? A label such as 'personal attack' is optional; explain the error.

Model Answer

Maya asks whether the timetable improves attendance. Lee attacks her motives instead of supplying attendance evidence. Better reply: 'We have not yet shown that attendance improves. We should compare attendance under the new and old schedules while checking other changes, such as transport availability.'

Why it is adequate. It identifies the diversion and replaces it with a relevant, honest response rather than an invented justification.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

During a debate about evening bus service for late-shift workers, Riley asks for one more small test before the city council decides. Avery replies, "Riley wants to block every improvement forever." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Straw man: misstates a view before attacking it as if it were real
C. Ad hominem: attacks the person rather than answering the argument	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches straw man.
Study link: LogFall - False dilemma

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches straw man.
Study link: LogFall - Hasty generalization

Question 2

Level 1

During a debate about classroom phone lockers, Maya says, "Either the school board must require phone lockers during class right now, or it does not care about ninth-grade students at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Slippery slope: predicts a chain reaction without enough support	**D.** Red herring: changes the subject instead of addressing the issue

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches false dilemma.
Study link: LogFall - Argumentum ad populum

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches false dilemma.
Study link: LogFall - Slippery slope

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches false dilemma.
Study link: LogFall - Red herring

Question 3

Level 1

During a debate about medication reminder texts for older patients, Sam rejects Morgan's proposal to send medication reminder texts before evening doses because Morgan once made a budgeting mistake. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Slippery slope: predicts a chain reaction without enough support
C. False dilemma: pretends two choices are the only realistic options	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches ad hominem.
Study link: LogFall - Slippery slope

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 4

Level 1

During a debate about a four-day workweek test for software engineers, Avery says, "If the company agrees to test a Monday-through-Thursday workweek, soon every related rule will fall apart." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Slippery slope: predicts a chain reaction without enough support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches slippery slope.
Study link: LogFall - Argumentum ad populum

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches slippery slope.
Study link: LogFall - Hasty generalization

Question 5

Level 1

During a debate about larger grocery unit-price labels, Taylor says the grocery chain should add larger unit-price labels on shelf tags because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. False dilemma: pretends two choices are the only realistic options	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to popularity.
Study link: LogFall - Red herring

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

Question 6

Level 1

During a debate about late fines on children's books, Morgan writes that the library should waive late fines for children's books because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Slippery slope: predicts a chain reaction without enough support
C. Straw man: misstates a view before attacking it as if it were real	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches circular reasoning.
Study link: LogFall - Slippery slope

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches circular reasoning.
Study link: LogFall - Straw man argument

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches circular reasoning.
Study link: LogFall - False dilemma

Question 7

Level 1

During a debate about two-factor login for site administrators, Casey points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Straw man: misstates a view before attacking it as if it were real
C. Slippery slope: predicts a chain reaction without enough support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches hasty generalization.
Study link: LogFall - Straw man argument

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches hasty generalization.
Study link: LogFall - Slippery slope

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 8

Level 1

During a debate about brighter streetlights on Maple Street, Sam asks whether adding brighter LED streetlights on Maple Street would affect reported thefts. Jordan answers by talking about this side detail: the new light poles are made of aluminum. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Red herring: changes the subject instead of addressing the issue	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches red herring.
Study link: LogFall - Hasty generalization

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches red herring.
Study link: LogFall - Argumentum ad populum

Question 9

Level 1

During a debate about peer tutoring for first-year statistics students, Riley says the university should not expand peer tutoring in statistics because the old way has been used for many years. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. False dilemma: pretends two choices are the only realistic options	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to tradition.
Study link: LogFall - False dilemma

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

Question 10

Level 1

During a debate about calorie labels on restaurant menus, Maya says, "Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Straw man: misstates a view before attacking it as if it were real
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 11

Level 1

During a debate about bank overdraft warning texts, Sam asks for one more small test before the bank decides. Morgan replies, "Sam wants to block every improvement forever." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Slippery slope: predicts a chain reaction without enough support
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: A. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches straw man.
Study link: LogFall - Slippery slope

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches straw man.
Study link: LogFall - Argumentum ad populum

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

Question 12

Level 1

During a debate about timed-entry passes for weekend park trails, Avery says, "Either the park service must use timed-entry passes for weekend trail visits right now, or it does not care about weekend trail hikers at all." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** False dilemma: pretends two choices are the only realistic options
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: B. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches false dilemma.
Study link: LogFall - Red herring

B. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches false dilemma.
Study link: LogFall - Argumentum ad populum

Question 13

Level 1

During a debate about free Friday museum admission, Taylor rejects Jordan's proposal to offer free admission on Fridays because Jordan once made a budgeting mistake. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Ad hominem: attacks the person rather than answering the argument	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: C. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches ad hominem.
Study link: LogFall - Argumentum ad populum

C. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches ad hominem.
Study link: LogFall - Slippery slope

Question 14

Level 1

During a debate about youth soccer concussion checks, Morgan says, "If the sports league agrees to add mandatory sideline concussion checks, soon every related rule will fall apart." Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Straw man: misstates a view before attacking it as if it were real
C. Red herring: changes the subject instead of addressing the issue	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: D. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches slippery slope.
Study link: LogFall - Appeal to tradition

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

D. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

Question 15

Level 1

During a debate about same-day donation receipts, Casey says the nonprofit should send donation receipts within one day because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** False dilemma: pretends two choices are the only realistic options
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: A. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to popularity.
Study link: LogFall - Hasty generalization

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to popularity.
Study link: LogFall - Ad hominem

Question 16

Level 1

During a debate about warehouse ergonomic training, Jordan writes that the warehouse should offer monthly lifting-safety and ergonomic training because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: B. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

B. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches circular reasoning.
Study link: LogFall - Post hoc ergo propter hoc

Question 17

Level 1

During a debate about apartment-lobby compost bins, Riley points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

C. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches hasty generalization.
Study link: LogFall - False dilemma

Question 18

Level 1

During a debate about private-by-default app profiles, Taylor asks whether making new user profiles private by default would affect publicly visible profiles. Maya answers by talking about this side detail: the privacy screen uses a shield icon. Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Slippery slope: predicts a chain reaction without enough support
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Red herring: changes the subject instead of addressing the issue

Answer: D. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches red herring.
Study link: LogFall - Straw man argument

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

D. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

Question 19

Level 1

During a debate about same-day clinic appointment slots, Sam says the clinic should not reserve same-day appointment slots because the old way has been used for many years. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Straw man: misstates a view before attacking it as if it were real
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: A. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to tradition.
Study link: LogFall - Straw man argument

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches appeal to tradition.
Study link: LogFall - Argumentum ad populum

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

Question 20

Level 1

During a debate about seat-zone airline boarding, Avery says, "Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Slippery slope: predicts a chain reaction without enough support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: B. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

B. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches post hoc.
Study link: LogFall - Slippery slope

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

Question 21

Level 1

During a debate about an online apartment repair portal, Taylor asks for one more small test before the landlord decides. Jordan replies, "Taylor wants to block every improvement forever." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches straw man.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches straw man.
Study link: LogFall - Argumentum ad populum

Question 22

Level 1

During a debate about fruit placement in a school cafeteria line, Morgan says, "Either the cafeteria must move fruit bowls to the front of the cafeteria line right now, or it does not care about middle-school students at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Ad hominem: attacks the person rather than answering the argument	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

Question 23

Level 1

During a debate about weekly call-center script coaching, Casey rejects Maya's proposal to give support agents weekly script coaching because Maya once made a budgeting mistake. Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Straw man: misstates a view before attacking it as if it were real
C. False dilemma: pretends two choices are the only realistic options	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches ad hominem.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 24

Level 1

During a debate about household water-leak alerts, Jordan says, "If the water utility agrees to send automatic household water-leak alerts, soon every related rule will fall apart." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** False dilemma: pretends two choices are the only realistic options
C. Slippery slope: predicts a chain reaction without enough support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches slippery slope.
Study link: LogFall - Hasty generalization

Question 25

Level 1

During a debate about body-camera activation reminders, Riley says the police department should send body-camera activation reminders before patrol shifts because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. False dilemma: pretends two choices are the only realistic options	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to popularity.
Study link: LogFall - Red herring

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to popularity.
Study link: LogFall - Ad hominem

Question 26

Level 1

During a debate about county mail-ballot tracking, Maya writes that the election office should offer online mail-ballot tracking because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Slippery slope: predicts a chain reaction without enough support
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches circular reasoning.
Study link: LogFall - Slippery slope

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches circular reasoning.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches circular reasoning.
Study link: LogFall - Straw man argument

Question 27

Level 1

During a debate about language-learning spaced-review prompts, Sam points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** False dilemma: pretends two choices are the only realistic options
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches hasty generalization.
Study link: LogFall - False dilemma

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches hasty generalization.
Study link: LogFall - Begging the question

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 28

Level 1

During a debate about a beginner gym orientation, Casey asks whether offering a beginner gym orientation would affect new-member cancellations. Avery answers by talking about this side detail: the orientation mats are black. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Red herring: changes the subject instead of addressing the issue	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches red herring.
Study link: LogFall - Argumentum ad populum

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches red herring.
Study link: LogFall - Straw man argument

Question 29

Level 1

During a debate about safe-driving feedback for policyholders, Taylor says the insurer should not send weekly safe-driving feedback because the old way has been used for many years. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Circular reasoning: uses the conclusion itself as its main support
C. False dilemma: pretends two choices are the only realistic options	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: D. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to tradition.
Study link: LogFall - False dilemma

D. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

Question 30

Level 1

During a debate about top-of-article correction boxes, Morgan says, "Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: C. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches post hoc.
Study link: LogFall - Ad hominem

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches post hoc.
Study link: LogFall - Begging the question

C. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

Question 31

Level 1

During a debate about clearer farmers market price signs, Casey asks for one more small test before the farmers market decides. Maya replies, "Casey wants to block every improvement forever." Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Ad hominem: attacks the person rather than answering the argument
C. Straw man: misstates a view before attacking it as if it were real	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: C. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches straw man.
Study link: LogFall - Argumentum ad populum

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

C. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches straw man.
Study link: LogFall - Slippery slope

Question 32

Level 1

During a debate about hotel quiet-hours text reminders, Jordan says, "Either the hotel must send quiet-hours text reminders to hotel guests right now, or it does not care about overnight hotel guests at all." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Post hoc: treats timing as enough proof of cause by itself	**D.** False dilemma: pretends two choices are the only realistic options

Answer: D. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches false dilemma.
Study link: LogFall - Appeal to tradition

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

D. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

During a debate about evening bus service for late-shift workers, Maya says, "Either the city council must extend evening bus service until midnight right now, or it does not care about late-shift workers at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches false dilemma.
Study link: LogFall - Appeal to tradition

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

Question 34

Level 2

During a debate about classroom phone lockers, Sam rejects Morgan's proposal to require phone lockers during class because Morgan once made a budgeting mistake. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Ad hominem: attacks the person rather than answering the argument
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

B. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

Question 35

Level 2

During a debate about medication reminder texts for older patients, Avery says, "If the hospital agrees to send medication reminder texts before evening doses, soon every related rule will fall apart." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** False dilemma: pretends two choices are the only realistic options
C. Slippery slope: predicts a chain reaction without enough support	**D.** Red herring: changes the subject instead of addressing the issue

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches slippery slope.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

Question 36

Level 2

During a debate about a four-day workweek test for software engineers, Taylor says the company should test a Monday-through-Thursday workweek because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Circular reasoning: uses the conclusion itself as its main support
C. False dilemma: pretends two choices are the only realistic options	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: D. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to popularity.
Study link: LogFall - Red herring

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

D. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

Question 37

Level 2

During a debate about larger grocery unit-price labels, Morgan writes that the grocery chain should add larger unit-price labels on shelf tags because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Red herring: changes the subject instead of addressing the issue	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches circular reasoning.
Study link: LogFall - Red herring

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches circular reasoning.
Study link: LogFall - False dilemma

Question 38

Level 2

During a debate about late fines on children's books, Casey points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Ad hominem: attacks the person rather than answering the argument	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: B. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

B. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches hasty generalization.
Study link: LogFall - Straw man argument

Question 39

Level 2

During a debate about two-factor login for site administrators, Sam asks whether requiring two-factor login for site administrators would affect admin account takeovers. Jordan answers by talking about this side detail: the login button changed from green to blue. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches red herring.
Study link: LogFall - Hasty generalization

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches red herring.
Study link: LogFall - Straw man argument

Question 40

Level 2

During a debate about brighter streetlights on Maple Street, Riley says the neighborhood association should not add brighter LED streetlights on Maple Street because the old way has been used for many years. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: D. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to tradition.
Study link: LogFall - False dilemma

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches appeal to tradition.
Study link: LogFall - Argumentum ad populum

D. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

Question 41

Level 2

During a debate about peer tutoring for first-year statistics students, Maya says, "Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Post hoc: treats timing as enough proof of cause by itself	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

C. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 42

Level 2

During a debate about calorie labels on restaurant menus, Sam asks for one more small test before the restaurant group decides. Morgan replies, "Sam wants to block every improvement forever." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Red herring: changes the subject instead of addressing the issue
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: D. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches straw man.
Study link: LogFall - False dilemma

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches straw man.
Study link: LogFall - Argumentum ad populum

D. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

Question 43

Level 2

During a debate about bank overdraft warning texts, Avery says, "Either the bank must send overdraft warning texts before fees post right now, or it does not care about checking-account customers at all." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** False dilemma: pretends two choices are the only realistic options
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: B. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches false dilemma.
Study link: LogFall - Red herring

B. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

Question 44

Level 2

During a debate about timed-entry passes for weekend park trails, Taylor rejects Jordan's proposal to use timed-entry passes for weekend trail visits because Jordan once made a budgeting mistake. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches ad hominem.
Study link: LogFall - Slippery slope

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches ad hominem.
Study link: LogFall - Argumentum ad populum

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 45

Level 2

During a debate about free Friday museum admission, Morgan says, "If the museum agrees to offer free admission on Fridays, soon every related rule will fall apart." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Slippery slope: predicts a chain reaction without enough support
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

B. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches slippery slope.
Study link: LogFall - Appeal to tradition

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

Question 46

Level 2

During a debate about youth soccer concussion checks, Casey says the sports league should add mandatory sideline concussion checks because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** False dilemma: pretends two choices are the only realistic options
C. Slippery slope: predicts a chain reaction without enough support	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: A. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to popularity.
Study link: LogFall - Slippery slope

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to popularity.
Study link: LogFall - Ad hominem

Question 47

Level 2

During a debate about same-day donation receipts, Jordan writes that the nonprofit should send donation receipts within one day because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** False dilemma: pretends two choices are the only realistic options
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: D. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches circular reasoning.
Study link: LogFall - Ad hominem

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches circular reasoning.
Study link: LogFall - False dilemma

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches circular reasoning.
Study link: LogFall - Appeal to tradition

D. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

Question 48

Level 2

During a debate about warehouse ergonomic training, Riley points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Ad hominem: attacks the person rather than answering the argument
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: C. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

C. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

Question 49

Level 2

During a debate about apartment-lobby compost bins, Taylor asks whether placing compost bins in apartment lobbies would affect landfill waste from participating buildings. Maya answers by talking about this side detail: the lobby compost bins have foot pedals. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Red herring: changes the subject instead of addressing the issue
C. Ad hominem: attacks the person rather than answering the argument	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: B. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches red herring.
Study link: LogFall - Begging the question

B. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches red herring.
Study link: LogFall - Ad hominem

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches red herring.
Study link: LogFall - Argumentum ad populum

Question 50

Level 2

During a debate about private-by-default app profiles, Sam says the app maker should not make new user profiles private by default because the old way has been used for many years. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** False dilemma: pretends two choices are the only realistic options
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: A. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to tradition.
Study link: LogFall - False dilemma

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

Question 51

Level 2

During a debate about same-day clinic appointment slots, Avery says, "Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: D. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches post hoc.
Study link: LogFall - Ad hominem

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

D. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

Question 52

Level 2

During a debate about seat-zone airline boarding, Taylor asks for one more small test before the airline decides. Jordan replies, "Taylor wants to block every improvement forever." Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Straw man: misstates a view before attacking it as if it were real
C. Ad hominem: attacks the person rather than answering the argument	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches straw man.
Study link: LogFall - Hasty generalization

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches straw man.
Study link: LogFall - Post hoc ergo propter hoc

Question 53

Level 2

During a debate about an online apartment repair portal, Morgan says, "Either the landlord must launch an online apartment repair portal right now, or it does not care about apartment tenants at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches false dilemma.
Study link: LogFall - Appeal to tradition

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches false dilemma.
Study link: LogFall - Slippery slope

Question 54

Level 2

During a debate about fruit placement in a school cafeteria line, Casey rejects Maya's proposal to move fruit bowls to the front of the cafeteria line because Maya once made a budgeting mistake. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** False dilemma: pretends two choices are the only realistic options
C. Ad hominem: attacks the person rather than answering the argument	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: C. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

C. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

Question 55

Level 2

During a debate about weekly call-center script coaching, Jordan says, "If the call center agrees to give support agents weekly script coaching, soon every related rule will fall apart." Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. Slippery slope: predicts a chain reaction without enough support	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches slippery slope.
Study link: LogFall - Hasty generalization

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

Question 56

Level 2

During a debate about household water-leak alerts, Riley says the water utility should send automatic household water-leak alerts because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: D. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to popularity.
Study link: LogFall - Slippery slope

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to popularity.
Study link: LogFall - Hasty generalization

D. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

Question 57

Level 2

During a debate about body-camera activation reminders, Maya writes that the police department should send body-camera activation reminders before patrol shifts because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Slippery slope: predicts a chain reaction without enough support
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches circular reasoning.
Study link: LogFall - Slippery slope

C. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches circular reasoning.
Study link: LogFall - Straw man argument

Question 58

Level 2

During a debate about county mail-ballot tracking, Sam points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Straw man: misstates a view before attacking it as if it were real	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches hasty generalization.
Study link: LogFall - Begging the question

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches hasty generalization.
Study link: LogFall - Straw man argument

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 59

Level 2

During a debate about language-learning spaced-review prompts, Casey asks whether sending spaced-review prompts for language vocabulary would affect vocabulary retention quiz scores. Avery answers by talking about this side detail: the review prompts use a bell icon. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Slippery slope: predicts a chain reaction without enough support	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches red herring.
Study link: LogFall - False dilemma

Question 60

Level 2

During a debate about a beginner gym orientation, Taylor says the gym should not offer a beginner gym orientation because the old way has been used for many years. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Red herring: changes the subject instead of addressing the issue	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

Question 61

Level 2

During a debate about safe-driving feedback for policyholders, Morgan says, "Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Straw man: misstates a view before attacking it as if it were real
C. Post hoc: treats timing as enough proof of cause by itself	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

C. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 62

Level 2

During a debate about top-of-article correction boxes, Casey asks for one more small test before the newsroom decides. Maya replies, "Casey wants to block every improvement forever." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Red herring: changes the subject instead of addressing the issue	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: A. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches straw man.
Study link: LogFall - Appeal to tradition

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches straw man.
Study link: LogFall - Hasty generalization

Question 63

Level 2

During a debate about clearer farmers market price signs, Jordan says, "Either the farmers market must require clearer price signs at vendor stalls right now, or it does not care about weekend farmers market shoppers at all." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** False dilemma: pretends two choices are the only realistic options
C. Slippery slope: predicts a chain reaction without enough support	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: B. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

B. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches false dilemma.
Study link: LogFall - Slippery slope

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

Question 64

Level 2

During a debate about hotel quiet-hours text reminders, Riley rejects Avery's proposal to send quiet-hours text reminders to hotel guests because Avery once made a budgeting mistake. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Straw man: misstates a view before attacking it as if it were real
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: A. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches ad hominem.
Study link: LogFall - Argumentum ad populum

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

During a debate about evening bus service for late-shift workers, Sam rejects Morgan's proposal to extend evening bus service until midnight because Morgan once made a budgeting mistake. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Slippery slope: predicts a chain reaction without enough support
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches ad hominem.
Study link: LogFall - Slippery slope

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches ad hominem.
Study link: LogFall - Hasty generalization

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 66

Level 3

During a debate about classroom phone lockers, Avery says, "If the school board agrees to require phone lockers during class, soon every related rule will fall apart." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** False dilemma: pretends two choices are the only realistic options
C. Slippery slope: predicts a chain reaction without enough support	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.

Study link: LogFall - Begging the question

Question 67

Level 3

During a debate about medication reminder texts for older patients, Taylor says the hospital should send medication reminder texts before evening doses because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to popularity.
Study link: LogFall - Hasty generalization

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

Question 68

Level 3

During a debate about a four-day workweek test for software engineers, Morgan writes that the company should test a Monday-through-Thursday workweek because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** False dilemma: pretends two choices are the only realistic options
C. Red herring: changes the subject instead of addressing the issue	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches circular reasoning.
Study link: LogFall - False dilemma

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches circular reasoning.
Study link: LogFall - Red herring

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.

Study link: LogFall - Hasty generalization

Question 69

Level 3

During a debate about larger grocery unit-price labels, Casey points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Red herring: changes the subject instead of addressing the issue
C. Ad hominem: attacks the person rather than answering the argument	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 70

Level 3

During a debate about late fines on children's books, Sam asks whether waiving late fines for children's books would affect library card renewals. Jordan answers by talking about this side detail: the children's-book checkout desk moved six feet. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** False dilemma: pretends two choices are the only realistic options
C. Red herring: changes the subject instead of addressing the issue	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches red herring.
Study link: LogFall - Hasty generalization

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches red herring.
Study link: LogFall - False dilemma

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

Question 71

Level 3

During a debate about two-factor login for site administrators, Riley says the platform should not require two-factor login for site administrators because the old way has been used for many years. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Red herring: changes the subject instead of addressing the issue	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

Question 72

Level 3

During a debate about brighter streetlights on Maple Street, Maya says, "Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Straw man: misstates a view before attacking it as if it were real	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 73

Level 3

During a debate about peer tutoring for first-year statistics students, Sam asks for one more small test before the university decides. Morgan replies, "Sam wants to block every improvement forever." Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: D. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches straw man.
Study link: LogFall - Hasty generalization

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches straw man.
Study link: LogFall - Appeal to tradition

D. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

Question 74

Level 3

During a debate about calorie labels on restaurant menus, Avery says, "Either the restaurant group must show calorie labels on printed lunch menus right now, or it does not care about lunch customers at all." Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. False dilemma: pretends two choices are the only realistic options	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: C. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

C. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

Question 75

Level 3

During a debate about bank overdraft warning texts, Taylor rejects Jordan's proposal to send overdraft warning texts before fees post because Jordan once made a budgeting mistake. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Red herring: changes the subject instead of addressing the issue
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: A. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches ad hominem.
Study link: LogFall - Red herring

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches ad hominem.
Study link: LogFall - Argumentum ad populum

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

Question 76

Level 3

During a debate about timed-entry passes for weekend park trails, Morgan says, "If the park service agrees to use timed-entry passes for weekend trail visits, soon every related rule will fall apart." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Slippery slope: predicts a chain reaction without enough support
C. Ad hominem: attacks the person rather than answering the argument	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

B. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

Question 77

Level 3

During a debate about free Friday museum admission, Casey says the museum should offer free admission on Fridays because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to popularity.
Study link: LogFall - Hasty generalization

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

C. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

Question 78

Level 3

During a debate about youth soccer concussion checks, Jordan writes that the sports league should add mandatory sideline concussion checks because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. Slippery slope: predicts a chain reaction without enough support	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: D. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches circular reasoning.
Study link: LogFall - Ad hominem

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches circular reasoning.
Study link: LogFall - Slippery slope

D. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

Question 79

Level 3

During a debate about same-day donation receipts, Riley points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** False dilemma: pretends two choices are the only realistic options
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Red herring: changes the subject instead of addressing the issue

Answer: C. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches hasty generalization.
Study link: LogFall - False dilemma

C. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

Question 80

Level 3

During a debate about warehouse ergonomic training, Taylor asks whether offering monthly lifting-safety and ergonomic training would affect back-injury claims. Maya answers by talking about this side detail: the training room has a ceiling-mounted projector. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: A. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches red herring.
Study link: LogFall - Argumentum ad populum

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

Question 81

Level 3

During a debate about apartment-lobby compost bins, Sam says the city sanitation office should not place compost bins in apartment lobbies because the old way has been used for many years. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: C. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches appeal to tradition.
Study link: LogFall - Argumentum ad populum

C. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

Question 82

Level 3

During a debate about private-by-default app profiles, Avery says, "Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Straw man: misstates a view before attacking it as if it were real
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: A. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

Question 83

Level 3

During a debate about same-day clinic appointment slots, Taylor asks for one more small test before the clinic decides. Jordan replies, "Taylor wants to block every improvement forever." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Straw man: misstates a view before attacking it as if it were real	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: C. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches straw man.
Study link: LogFall - Slippery slope

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

C. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

Question 84

Level 3

During a debate about seat-zone airline boarding, Morgan says, "Either the airline must board passengers by seat zone right now, or it does not care about domestic flight passengers at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Straw man: misstates a view before attacking it as if it were real	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches false dilemma.
Study link: LogFall - Straw man argument

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches false dilemma.
Study link: LogFall - Argumentum ad populum

Question 85

Level 3

During a debate about an online apartment repair portal, Casey rejects Maya's proposal to launch an online apartment repair portal because Maya once made a budgeting mistake. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: B. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches ad hominem.
Study link: LogFall - Hasty generalization

B. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches ad hominem.
Study link: LogFall - Argumentum ad populum

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

Question 86

Level 3

During a debate about fruit placement in a school cafeteria line, Jordan says, "If the cafeteria agrees to move fruit bowls to the front of the cafeteria line, soon every related rule will fall apart." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. False dilemma: pretends two choices are the only realistic options	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: D. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches slippery slope.
Study link: LogFall - Hasty generalization

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

D. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

Question 87

Level 3

During a debate about weekly call-center script coaching, Riley says the call center should give support agents weekly script coaching because the idea received the most likes in an online poll. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Ad hominem: attacks the person rather than answering the argument	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to popularity.
Study link: LogFall - Ad hominem

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches appeal to popularity.
Study link: LogFall - Appeal to tradition

Question 88

Level 3

During a debate about household water-leak alerts, Maya writes that the water utility should send automatic household water-leak alerts because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches circular reasoning.
Study link: LogFall - Appeal to tradition

Question 89

Level 3

During a debate about body-camera activation reminders, Sam points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Slippery slope: predicts a chain reaction without enough support	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: B. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

B. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches hasty generalization.
Study link: LogFall - Slippery slope

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

Question 90

Level 3

During a debate about county mail-ballot tracking, Casey asks whether offering online mail-ballot tracking would affect phone calls asking ballot status. Avery answers by talking about this side detail: the ballot-tracking page uses county colors. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Red herring: changes the subject instead of addressing the issue

Answer: D. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches red herring.
Study link: LogFall - False dilemma

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches red herring.
Study link: LogFall - Begging the question

D. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

Question 91

Level 3

During a debate about language-learning spaced-review prompts, Taylor says the tutoring app should not send spaced-review prompts for language vocabulary because the old way has been used for many years. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

Question 92

Level 3

During a debate about a beginner gym orientation, Morgan says, "New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Slippery slope: predicts a chain reaction without enough support
C. False dilemma: pretends two choices are the only realistic options	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: D. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches post hoc.
Study link: LogFall - Slippery slope

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

D. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

Question 93

Level 3

During a debate about safe-driving feedback for policyholders, Casey asks for one more small test before the insurer decides. Maya replies, "Casey wants to block every improvement forever." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Ad hominem: attacks the person rather than answering the argument	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches straw man.
Study link: LogFall - False dilemma

Question 94

Level 3

During a debate about top-of-article correction boxes, Jordan says, "Either the newsroom must place corrections at the top of articles right now, or it does not care about newsletter readers at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Straw man: misstates a view before attacking it as if it were real
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches false dilemma.
Study link: LogFall - Straw man argument

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches false dilemma.
Study link: LogFall - Appeal to tradition

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches false dilemma.
Study link: LogFall - Argumentum ad populum

Question 95

Level 3

During a debate about clearer farmers market price signs, Riley rejects Avery's proposal to require clearer price signs at vendor stalls because Avery once made a budgeting mistake. Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Ad hominem: attacks the person rather than answering the argument	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: C. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches ad hominem.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

C. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches ad hominem.
Study link: LogFall - Hasty generalization

Question 96

Level 3

During a debate about hotel quiet-hours text reminders, Maya says, "If the hotel agrees to send quiet-hours text reminders to hotel guests, soon every related rule will fall apart." Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Straw man: misstates a view before attacking it as if it were real
C. False dilemma: pretends two choices are the only realistic options	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: D. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches slippery slope.
Study link: LogFall - Argumentum ad populum

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

D. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

During a debate about evening bus service for late-shift workers, Avery says, "If the city council agrees to extend evening bus service until midnight, soon every related rule will fall apart." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Red herring: changes the subject instead of addressing the issue
C. Slippery slope: predicts a chain reaction without enough support	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: C. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

C. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

Question 98

Level 4

During a debate about classroom phone lockers, Taylor says the school board should require phone lockers during class because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** False dilemma: pretends two choices are the only realistic options
C. Straw man: misstates a view before attacking it as if it were real	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: D. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

D. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.

Study link: LogFall - Argumentum ad populum

Question 99

Level 4

During a debate about medication reminder texts for older patients, Morgan writes that the hospital should send medication reminder texts before evening doses because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Ad hominem: attacks the person rather than answering the argument
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches circular reasoning.
Study link: LogFall - Ad hominem

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

Question 100

Level 4

During a debate about a four-day workweek test for software engineers, Casey points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Slippery slope: predicts a chain reaction without enough support	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: B. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

B. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches hasty generalization.
Study link: LogFall - Slippery slope

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches hasty generalization.
Study link: LogFall - Straw man argument

Question 101

Level 4

During a debate about larger grocery unit-price labels, Sam asks whether adding larger unit-price labels on shelf tags would affect shopper overpayment complaints. Jordan answers by talking about this side detail: the shelf labels use bold black numbers. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Slippery slope: predicts a chain reaction without enough support
C. Red herring: changes the subject instead of addressing the issue	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

Question 102

Level 4

During a debate about late fines on children's books, Riley says the library should not waive late fines for children's books because the old way has been used for many years. Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Slippery slope: predicts a chain reaction without enough support
C. Ad hominem: attacks the person rather than answering the argument	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: D. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to tradition.
Study link: LogFall - Ad hominem

D. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

Question 103

Level 4

During a debate about two-factor login for site administrators, Maya says, "Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Ad hominem: attacks the person rather than answering the argument	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches post hoc.
Study link: LogFall - Ad hominem

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 104

Level 4

During a debate about brighter streetlights on Maple Street, Sam asks for one more small test before the neighborhood association decides. Morgan replies, "Sam wants to block every improvement forever." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches straw man.
Study link: LogFall - Slippery slope

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches straw man.
Study link: LogFall - Appeal to tradition

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

Question 105

Level 4

During a debate about peer tutoring for first-year statistics students, Avery says, "Either the university must expand peer tutoring in statistics right now, or it does not care about first-year statistics students at all." Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Post hoc: treats timing as enough proof of cause by itself
C. False dilemma: pretends two choices are the only realistic options	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: C. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

C. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

Question 106

Level 4

During a debate about calorie labels on restaurant menus, Taylor rejects Jordan's proposal to show calorie labels on printed lunch menus because Jordan once made a budgeting mistake. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Red herring: changes the subject instead of addressing the issue
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches ad hominem.
Study link: LogFall - Red herring

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches ad hominem.
Study link: LogFall - Hasty generalization

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 107

Level 4

During a debate about bank overdraft warning texts, Morgan says, "If the bank agrees to send overdraft warning texts before fees post, soon every related rule will fall apart." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. False dilemma: pretends two choices are the only realistic options	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: D. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches slippery slope.
Study link: LogFall - Argumentum ad populum

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

D. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

Question 108

Level 4

During a debate about timed-entry passes for weekend park trails, Casey says the park service should use timed-entry passes for weekend trail visits because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to popularity.
Study link: LogFall - Slippery slope

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to popularity.
Study link: LogFall - Post hoc ergo propter hoc

C. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

Question 109

Level 4

During a debate about free Friday museum admission, Jordan writes that the museum should offer free admission on Fridays because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Red herring: changes the subject instead of addressing the issue

Answer: B. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches circular reasoning.
Study link: LogFall - Slippery slope

B. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches circular reasoning.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches circular reasoning.
Study link: LogFall - Red herring

Question 110

Level 4

During a debate about youth soccer concussion checks, Riley points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: A. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches hasty generalization.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches hasty generalization.
Study link: LogFall - Straw man argument

Question 111

Level 4

During a debate about same-day donation receipts, Taylor asks whether sending donation receipts within one day would affect donor retention. Maya answers by talking about this side detail: the receipt email subject line changed. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Red herring: changes the subject instead of addressing the issue

Answer: D. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

B. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches red herring.
Study link: LogFall - Hasty generalization

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

D. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

Question 112

Level 4

During a debate about warehouse ergonomic training, Sam says the warehouse should not offer monthly lifting-safety and ergonomic training because the old way has been used for many years. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: C. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

C. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to tradition.
Study link: LogFall - Straw man argument

Question 113

Level 4

During a debate about apartment-lobby compost bins, Avery says, "Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Red herring: changes the subject instead of addressing the issue

Answer: B. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

B. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches post hoc.
Study link: LogFall - Red herring

Question 114

Level 4

During a debate about private-by-default app profiles, Taylor asks for one more small test before the app maker decides. Jordan replies, "Taylor wants to block every improvement forever." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Slippery slope: predicts a chain reaction without enough support	**D.** Red herring: changes the subject instead of addressing the issue

Answer: A. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches straw man.
Study link: LogFall - Argumentum ad populum

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches straw man.
Study link: LogFall - Slippery slope

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

Question 115

Level 4

During a debate about same-day clinic appointment slots, Morgan says, "Either the clinic must reserve same-day appointment slots right now, or it does not care about primary-care patients at all." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** False dilemma: pretends two choices are the only realistic options
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: B. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

B. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches false dilemma.
Study link: LogFall - Straw man argument

Question 116

Level 4

During a debate about seat-zone airline boarding, Casey rejects Maya's proposal to board passengers by seat zone because Maya once made a budgeting mistake. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** False dilemma: pretends two choices are the only realistic options
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: A. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches ad hominem.
Study link: LogFall - Begging the question

Question 117

Level 4

During a debate about an online apartment repair portal, Jordan says, "If the landlord agrees to launch an online apartment repair portal, soon every related rule will fall apart." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Red herring: changes the subject instead of addressing the issue	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

Question 118

Level 4

During a debate about fruit placement in a school cafeteria line, Riley says the cafeteria should move fruit bowls to the front of the cafeteria line because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Circular reasoning: uses the conclusion itself as its main support	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches appeal to popularity.
Study link: LogFall - Ad hominem

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

Question 119

Level 4

During a debate about weekly call-center script coaching, Maya writes that the call center should give support agents weekly script coaching because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Red herring: changes the subject instead of addressing the issue
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: C. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches circular reasoning.
Study link: LogFall - Red herring

C. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches circular reasoning.
Study link: LogFall - Appeal to tradition

Question 120

Level 4

During a debate about household water-leak alerts, Sam points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Ad hominem: attacks the person rather than answering the argument
C. Red herring: changes the subject instead of addressing the issue	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches hasty generalization.
Study link: LogFall - False dilemma

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 121

Level 4

During a debate about body-camera activation reminders, Casey asks whether sending body-camera activation reminders before patrol shifts would affect missing-camera-footage reports. Avery answers by talking about this side detail: the reminder tone is two beeps. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** False dilemma: pretends two choices are the only realistic options
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: A. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches red herring.
Study link: LogFall - False dilemma

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches red herring.
Study link: LogFall - Begging the question

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches red herring.
Study link: LogFall - Hasty generalization

Question 122

Level 4

During a debate about county mail-ballot tracking, Taylor says the election office should not offer online mail-ballot tracking because the old way has been used for many years. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Straw man: misstates a view before attacking it as if it were real	**D.** Red herring: changes the subject instead of addressing the issue

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to tradition.
Study link: LogFall - Straw man argument

D. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

Question 123

Level 4

During a debate about language-learning spaced-review prompts, Morgan says, "Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Straw man: misstates a view before attacking it as if it were real
C. Post hoc: treats timing as enough proof of cause by itself	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches post hoc.
Study link: LogFall - Straw man argument

C. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 124

Level 4

During a debate about a beginner gym orientation, Casey asks for one more small test before the gym decides. Maya replies, "Casey wants to block every improvement forever." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Ad hominem: attacks the person rather than answering the argument	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: D. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

D. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

Question 125

Level 4

During a debate about safe-driving feedback for policyholders, Jordan says, "Either the insurer must send weekly safe-driving feedback right now, or it does not care about auto-insurance policyholders at all." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Slippery slope: predicts a chain reaction without enough support
C. False dilemma: pretends two choices are the only realistic options	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: C. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

B. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches false dilemma.
Study link: LogFall - Slippery slope

C. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

Question 126

Level 4

During a debate about top-of-article correction boxes, Riley rejects Avery's proposal to place corrections at the top of articles because Avery once made a budgeting mistake. Which fallacy is showing up?

A. Appeal to tradition: treats old habits as proof the claim is right	**B.** Straw man: misstates a view before attacking it as if it were real
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: D. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches ad hominem.
Study link: LogFall - Appeal to tradition

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches ad hominem.
Study link: LogFall - Post hoc ergo propter hoc

D. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

Question 127

Level 4

During a debate about clearer farmers market price signs, Maya says, "If the farmers market agrees to require clearer price signs at vendor stalls, soon every related rule will fall apart." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Slippery slope: predicts a chain reaction without enough support
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

B. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches slippery slope.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

Question 128

Level 4

During a debate about hotel quiet-hours text reminders, Sam says the hotel should send quiet-hours text reminders to hotel guests because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: A. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to popularity.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to popularity.
Study link: LogFall - Red herring

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

During a debate about evening bus service for late-shift workers, Taylor says the city council should extend evening bus service until midnight because the idea received the most likes in an online poll. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: D. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to popularity.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to popularity.
Study link: LogFall - Red herring

D. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

Question 130

Level 5

During a debate about classroom phone lockers, Morgan writes that the school board should require phone lockers during class because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: C. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches circular reasoning.
Study link: LogFall - Ad hominem

C. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches circular reasoning.
Study link: LogFall - Appeal to tradition

Question 131

Level 5

During a debate about medication reminder texts for older patients, Casey points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Hasty generalization: jumps from little evidence to a broad claim
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: B. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches hasty generalization.
Study link: LogFall - Red herring

B. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

Question 132

Level 5

During a debate about a four-day workweek test for software engineers, Sam asks whether testing a Monday-through-Thursday workweek would affect staff resignations. Jordan answers by talking about this side detail: the test calendar starts on a Monday. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Slippery slope: predicts a chain reaction without enough support	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: A. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches red herring.
Study link: LogFall - Argumentum ad populum

C. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

Question 133

Level 5

During a debate about larger grocery unit-price labels, Riley says the grocery chain should not add larger unit-price labels on shelf tags because the old way has been used for many years. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Red herring: changes the subject instead of addressing the issue
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: D. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to tradition.
Study link: LogFall - False dilemma

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches appeal to tradition.
Study link: LogFall - Red herring

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

D. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

Question 134

Level 5

During a debate about late fines on children's books, Maya says, "Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: C. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches post hoc.
Study link: LogFall - Begging the question

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

C. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches post hoc.
Study link: LogFall - Ad hominem

Question 135

Level 5

During a debate about two-factor login for site administrators, Sam asks for one more small test before the platform decides. Morgan replies, "Sam wants to block every improvement forever." Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Straw man: misstates a view before attacking it as if it were real
C. Post hoc: treats timing as enough proof of cause by itself	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: B. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

B. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

C. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches straw man.
Study link: LogFall - Post hoc ergo propter hoc

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches straw man.
Study link: LogFall - Hasty generalization

Question 136

Level 5

During a debate about brighter streetlights on Maple Street, Avery says, "Either the neighborhood association must add brighter LED streetlights on Maple Street right now, or it does not care about residents on Maple Street at all." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Ad hominem: attacks the person rather than answering the argument
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: A. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

C. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches false dilemma.
Study link: LogFall - Appeal to tradition

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

Question 137

Level 5

During a debate about peer tutoring for first-year statistics students, Taylor rejects Jordan's proposal to expand peer tutoring in statistics because Jordan once made a budgeting mistake. Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Ad hominem: attacks the person rather than answering the argument
C. Straw man: misstates a view before attacking it as if it were real	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: B. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

B. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches ad hominem.
Study link: LogFall - Post hoc ergo propter hoc

Question 138

Level 5

During a debate about calorie labels on restaurant menus, Morgan says, "If the restaurant group agrees to show calorie labels on printed lunch menus, soon every related rule will fall apart." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Ad hominem: attacks the person rather than answering the argument	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: A. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches slippery slope.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

D. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

Question 139

Level 5

During a debate about bank overdraft warning texts, Casey says the bank should send overdraft warning texts before fees post because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Straw man: misstates a view before attacking it as if it were real
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** False dilemma: pretends two choices are the only realistic options

Answer: C. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to popularity.
Study link: LogFall - Slippery slope

B. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

C. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches appeal to popularity.
Study link: LogFall - False dilemma

Question 140

Level 5

During a debate about timed-entry passes for weekend park trails, Jordan writes that the park service should use timed-entry passes for weekend trail visits because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Ad hominem: attacks the person rather than answering the argument
C. Straw man: misstates a view before attacking it as if it were real	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: D. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches circular reasoning.
Study link: LogFall - Ad hominem

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches circular reasoning.
Study link: LogFall - Straw man argument

D. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

Question 141

Level 5

During a debate about free Friday museum admission, Riley points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: A. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches hasty generalization.
Study link: LogFall - Appeal to tradition

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches hasty generalization.
Study link: LogFall - Begging the question

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches hasty generalization.
Study link: LogFall - Argumentum ad populum

Question 142

Level 5

During a debate about youth soccer concussion checks, Taylor asks whether adding mandatory sideline concussion checks would affect repeat head injuries. Maya answers by talking about this side detail: the concussion checklist is printed on yellow paper. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Red herring: changes the subject instead of addressing the issue
C. False dilemma: pretends two choices are the only realistic options	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: B. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches red herring.
Study link: LogFall - Begging the question

B. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches red herring.
Study link: LogFall - False dilemma

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches red herring.
Study link: LogFall - Appeal to tradition

Question 143

Level 5

During a debate about same-day donation receipts, Sam says the nonprofit should not send donation receipts within one day because the old way has been used for many years. Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Appeal to tradition: treats old habits as proof the claim is right	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: C. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to tradition.
Study link: LogFall - Straw man argument

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

C. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

D. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to tradition.
Study link: LogFall - Hasty generalization

Question 144

Level 5

During a debate about warehouse ergonomic training, Avery says, "Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: D. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches post hoc.
Study link: LogFall - Red herring

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches post hoc.
Study link: LogFall - Hasty generalization

D. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

Question 145

Level 5

During a debate about apartment-lobby compost bins, Taylor asks for one more small test before the city sanitation office decides. Jordan replies, "Taylor wants to block every improvement forever." Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: A. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches straw man.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches straw man.
Study link: LogFall - Begging the question

Question 146

Level 5

During a debate about private-by-default app profiles, Morgan says, "Either the app maker must make new user profiles private by default right now, or it does not care about new app users at all." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** False dilemma: pretends two choices are the only realistic options
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: B. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches false dilemma.
Study link: LogFall - Post hoc ergo propter hoc

B. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches false dilemma.
Study link: LogFall - Hasty generalization

D. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches false dilemma.
Study link: LogFall - Begging the question

Question 147

Level 5

During a debate about same-day clinic appointment slots, Casey rejects Maya's proposal to reserve same-day appointment slots because Maya once made a budgeting mistake. Which fallacy is showing up?

A. Hasty generalization: jumps from little evidence to a broad claim	**B.** Red herring: changes the subject instead of addressing the issue
C. Ad hominem: attacks the person rather than answering the argument	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: C. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches ad hominem.
Study link: LogFall - Hasty generalization

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches ad hominem.
Study link: LogFall - Red herring

C. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches ad hominem.
Study link: LogFall - Post hoc ergo propter hoc

Question 148

Level 5

During a debate about seat-zone airline boarding, Jordan says, "If the airline agrees to board passengers by seat zone, soon every related rule will fall apart." Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** False dilemma: pretends two choices are the only realistic options
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: D. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches slippery slope.
Study link: LogFall - Red herring

B. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches slippery slope.
Study link: LogFall - False dilemma

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches slippery slope.
Study link: LogFall - Begging the question

D. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

Question 149

Level 5

During a debate about an online apartment repair portal, Riley says the landlord should launch an online apartment repair portal because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: B. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to popularity.
Study link: LogFall - Post hoc ergo propter hoc

B. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches appeal to popularity.
Study link: LogFall - Hasty generalization

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches appeal to popularity.
Study link: LogFall - Appeal to tradition

Question 150

Level 5

During a debate about fruit placement in a school cafeteria line, Maya writes that the cafeteria should move fruit bowls to the front of the cafeteria line because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Circular reasoning: uses the conclusion itself as its main support	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Hasty generalization: jumps from little evidence to a broad claim	**D.** Appeal to popularity: treats popularity as proof the claim is correct

Answer: A. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches circular reasoning.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Hasty generalization would involve a different mistake: it jumps from little evidence to a broad claim. The debate instead matches circular reasoning.
Study link: LogFall - Hasty generalization

D. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

Question 151

Level 5

During a debate about weekly call-center script coaching, Sam points to one group that reported success with a similar change and says the same result will happen everywhere. Which fallacy is showing up?

A. Ad hominem: attacks the person rather than answering the argument	**B.** Circular reasoning: uses the conclusion itself as its main support
C. False dilemma: pretends two choices are the only realistic options	**D.** Hasty generalization: jumps from little evidence to a broad claim

Answer: D. Hasty generalization: A broad conclusion is drawn from too little evidence.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Hasty generalization: jumps from little evidence to a broad claim. Use the other labels as contrast cases.

A. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches hasty generalization.
Study link: LogFall - Ad hominem

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches hasty generalization.
Study link: LogFall - Begging the question

C. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches hasty generalization.
Study link: LogFall - False dilemma

D. Correct. Hasty generalization: A broad conclusion is drawn from too little evidence. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Hasty generalization

Question 152

Level 5

During a debate about household water-leak alerts, Casey asks whether sending automatic household water-leak alerts would affect average household water use. Avery answers by talking about this side detail: the water-leak alert screen includes a blue droplet icon. Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Ad hominem: attacks the person rather than answering the argument
C. Red herring: changes the subject instead of addressing the issue	**D.** Slippery slope: predicts a chain reaction without enough support

Answer: C. Red herring: The response shifts attention to an irrelevant issue.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Red herring: changes the subject instead of addressing the issue. Use the other labels as contrast cases.

A. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches red herring.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches red herring.
Study link: LogFall - Ad hominem

C. Correct. Red herring: The response shifts attention to an irrelevant issue. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Red herring

D. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches red herring.
Study link: LogFall - Slippery slope

Question 153

Level 5

During a debate about body-camera activation reminders, Taylor says the police department should not send body-camera activation reminders before patrol shifts because the old way has been used for many years. Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Circular reasoning: uses the conclusion itself as its main support	**D.** Post hoc: treats timing as enough proof of cause by itself

Answer: B. Appeal to tradition: The argument treats age or tradition as enough proof.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Appeal to tradition: treats old habits as proof the claim is right. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches appeal to tradition.
Study link: LogFall - Slippery slope

B. Correct. Appeal to tradition: The argument treats age or tradition as enough proof. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Appeal to tradition

C. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to tradition.
Study link: LogFall - Begging the question

D. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches appeal to tradition.
Study link: LogFall - Post hoc ergo propter hoc

Question 154

Level 5

During a debate about county mail-ballot tracking, Morgan says, "Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it, so the policy must have caused the change." Which fallacy is showing up?

A. Post hoc: treats timing as enough proof of cause by itself	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** False dilemma: pretends two choices are the only realistic options

Answer: A. Post hoc: The argument assumes that because one event came after another, the first caused the second.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Post hoc: treats timing as enough proof of cause by itself. Use the other labels as contrast cases.

A. Correct. Post hoc: The argument assumes that because one event came after another, the first caused the second. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Post hoc ergo propter hoc

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches post hoc.
Study link: LogFall - Appeal to tradition

C. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches post hoc.
Study link: LogFall - Argumentum ad populum

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches post hoc.
Study link: LogFall - False dilemma

Question 155

Level 5

During a debate about language-learning spaced-review prompts, Casey asks for one more small test before the tutoring app decides. Maya replies, "Casey wants to block every improvement forever." Which fallacy is showing up?

A. False dilemma: pretends two choices are the only realistic options	**B.** Red herring: changes the subject instead of addressing the issue
C. Ad hominem: attacks the person rather than answering the argument	**D.** Straw man: misstates a view before attacking it as if it were real

Answer: D. Straw man: The reply attacks an exaggerated version of the other person's view.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Straw man: misstates a view before attacking it as if it were real. Use the other labels as contrast cases.

A. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches straw man.
Study link: LogFall - False dilemma

B. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches straw man.
Study link: LogFall - Red herring

C. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches straw man.
Study link: LogFall - Ad hominem

D. Correct. Straw man: The reply attacks an exaggerated version of the other person's view. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Straw man argument

Question 156

Level 5

During a debate about a beginner gym orientation, Jordan says, "Either the gym must offer a beginner gym orientation right now, or it does not care about new gym members at all." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Appeal to popularity: treats popularity as proof the claim is correct
C. False dilemma: pretends two choices are the only realistic options	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: C. False dilemma: The argument acts like there are only two choices when there may be more.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: False dilemma: pretends two choices are the only realistic options. Use the other labels as contrast cases.

A. Not correct. Slippery slope would involve a different mistake: it predicts a chain reaction without enough support. The debate instead matches false dilemma.
Study link: LogFall - Slippery slope

B. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches false dilemma.
Study link: LogFall - Argumentum ad populum

C. Correct. False dilemma: The argument acts like there are only two choices when there may be more. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - False dilemma

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches false dilemma.
Study link: LogFall - Ad hominem

Question 157

Level 5

During a debate about safe-driving feedback for policyholders, Riley rejects Avery's proposal to send weekly safe-driving feedback because Avery once made a budgeting mistake. Which fallacy is showing up?

A. Red herring: changes the subject instead of addressing the issue	**B.** Ad hominem: attacks the person rather than answering the argument
C. Straw man: misstates a view before attacking it as if it were real	**D.** False dilemma: pretends two choices are the only realistic options

Answer: B. Ad hominem: The response attacks the person instead of the argument.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is B because the scenario matches that pattern: Ad hominem: attacks the person rather than answering the argument. Use the other labels as contrast cases.

A. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches ad hominem.
Study link: LogFall - Red herring

B. Correct. Ad hominem: The response attacks the person instead of the argument. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Ad hominem

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches ad hominem.
Study link: LogFall - Straw man argument

D. Not correct. False dilemma would involve a different mistake: it pretends two choices are the only realistic options. The debate instead matches ad hominem.
Study link: LogFall - False dilemma

Question 158

Level 5

During a debate about top-of-article correction boxes, Maya says, "If the newsroom agrees to place corrections at the top of articles, soon every related rule will fall apart." Which fallacy is showing up?

A. Slippery slope: predicts a chain reaction without enough support	**B.** Appeal to tradition: treats old habits as proof the claim is right
C. Straw man: misstates a view before attacking it as if it were real	**D.** Ad hominem: attacks the person rather than answering the argument

Answer: A. Slippery slope: The argument predicts an extreme chain reaction without support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is A because the scenario matches that pattern: Slippery slope: predicts a chain reaction without enough support. Use the other labels as contrast cases.

A. Correct. Slippery slope: The argument predicts an extreme chain reaction without support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Slippery slope

B. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches slippery slope.
Study link: LogFall - Appeal to tradition

C. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches slippery slope.
Study link: LogFall - Straw man argument

D. Not correct. Ad hominem would involve a different mistake: it attacks the person rather than answering the argument. The debate instead matches slippery slope.
Study link: LogFall - Ad hominem

Question 159

Level 5

During a debate about clearer farmers market price signs, Sam says the farmers market should require clearer price signs at vendor stalls because the idea received the most likes in an online poll. Which fallacy is showing up?

A. Straw man: misstates a view before attacking it as if it were real	**B.** Circular reasoning: uses the conclusion itself as its main support
C. Appeal to popularity: treats popularity as proof the claim is correct	**D.** Appeal to tradition: treats old habits as proof the claim is right

Answer: C. Appeal to popularity: Popularity is treated as proof that the idea is correct.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is C because the scenario matches that pattern: Appeal to popularity: treats popularity as proof the claim is correct. Use the other labels as contrast cases.

A. Not correct. Straw man would involve a different mistake: it misstates a view before attacking it as if it were real. The debate instead matches appeal to popularity.
Study link: LogFall - Straw man argument

B. Not correct. Circular reasoning would involve a different mistake: it uses the conclusion itself as its main support. The debate instead matches appeal to popularity.
Study link: LogFall - Begging the question

C. Correct. Appeal to popularity: Popularity is treated as proof that the idea is correct. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Argumentum ad populum

D. Not correct. Appeal to tradition would involve a different mistake: it treats old habits as proof the claim is right. The debate instead matches appeal to popularity.
Study link: LogFall - Appeal to tradition

Question 160

Level 5

During a debate about hotel quiet-hours text reminders, Avery writes that the hotel should send quiet-hours text reminders to hotel guests because it is the right move, and it is the right move because it should be done. Which fallacy is showing up?

A. Appeal to popularity: treats popularity as proof the claim is correct	**B.** Post hoc: treats timing as enough proof of cause by itself
C. Red herring: changes the subject instead of addressing the issue	**D.** Circular reasoning: uses the conclusion itself as its main support

Answer: D. Circular reasoning: The conclusion is used as its own support.

How to work it out. To uncover the answer, describe the bad move before naming it. The correct choice is D because the scenario matches that pattern: Circular reasoning: uses the conclusion itself as its main support. Use the other labels as contrast cases.

A. Not correct. Appeal to popularity would involve a different mistake: it treats popularity as proof the claim is correct. The debate instead matches circular reasoning.
Study link: LogFall - Argumentum ad populum

B. Not correct. Post hoc would involve a different mistake: it treats timing as enough proof of cause by itself. The debate instead matches circular reasoning.
Study link: LogFall - Post hoc ergo propter hoc

C. Not correct. Red herring would involve a different mistake: it changes the subject instead of addressing the issue. The debate instead matches circular reasoning.
Study link: LogFall - Red herring

D. Correct. Circular reasoning: The conclusion is used as its own support. The wording of the choice names the same mistake shown in the debate.
Study link: LogFall - Begging the question

Skill 10

Think Probabilistically

How Likely Is It?

Choose the answer that handles chance and uncertainty well. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	How should uncertainty affect what we expect?
Why it matters	Probability helps people think between impossible and guaranteed. Many real decisions involve signals, forecasts, false alarms, base rates, and uncertainty rather than proof.
Conceptual core	Probability gives students language for partial belief. Many claims are neither proved nor disproved; they are more or less likely given the information available. Students need to distinguish chance from certainty, risk from outcome, signal from guarantee, and individual cases from long-run frequencies. This is essential for forecasts, tests, warnings, and everyday planning.
Student method	Translate percentages into out-of-100 language. Ask whether the number is a chance, a frequency, a warning signal, or a guarantee. Keep uncertainty visible.
Analogy	Probability is a weather forecast for belief. A 70 percent chance of rain matters, but it is not the same as rain already falling.
Assessment focus	A good answer uses the probability as evidence without turning it into certainty or dismissing it as useless.

Teaching Sequence

1. Translate percentages into out-of-100 language.

2. Ask whether the number describes a chance, a frequency, a false alarm rate, or a prediction.

3. Keep likely separate from certain and unlikely separate from impossible.

4. Notice when the evidence changes odds without settling the result.

Common Confusions To Watch For

1. Students may treat a high probability as a guarantee.

2. Students may treat a low probability as impossible.

3. Students may ignore the base rate or the group the probability applies to.

Teacher Prompts

1. Out of 100 similar cases, about how many would we expect?

2. Does this number tell us what will happen here, or how often it tends to happen?

3. What uncertainty remains?

Worked Example

Scenario	A weather app says there is a 70 percent chance of rain in town tomorrow.
Teacher think-aloud	That does not mean it will rain for 70 percent of the day or that rain is guaranteed. It means that in similar forecast situations, rain would occur about 70 out of 100 times.
Student takeaway	Probability guides expectations while leaving room for uncertainty.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A weather app assigns a 70% chance of measurable rain tomorrow. For this exercise, measurable rain means at least 1 mm at the town weather station during that calendar day. Imagine 100 comparable forecasts, each issued a day ahead at 70%, from a well-calibrated app: its stated probabilities match long-run frequencies.

What To Do

1. Write approximately how many of those 100 days should have measurable rain and how many should not.

2. Explain why a dry tomorrow would not by itself refute a 70% forecast.

3. Write what record you would inspect to judge whether the app's 70% forecasts are well calibrated.

Check before reading the answer. Do not treat 70% as a guarantee, a claim about 70% of the town, or a claim that rain lasts 70% of the day.

Model Answer

About 70 days should have measurable rain and about 30 should not; exact counts can vary. A dry tomorrow is allowed by the 30% chance of no rain. I would inspect many comparable forecasts recorded in advance at 70%, keeping dry days as well as wet ones, and compare their rain frequency with 70%.

Why it is adequate. It identifies the event and reference group and evaluates a probabilistic claim across a record rather than a single outcome.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

A month-ahead forecast for evening bus service for late-shift workers says the chance is 25 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 25 out of 100 times.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 2

Level 1

A month-ahead forecast for classroom phone lockers says the chance is 30 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** If there were 100 similar forecasts, about 30 would be expected to improve.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 3

Level 1

A month-ahead forecast for medication reminder texts for older patients says the chance is 40 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 4

Level 1

A month-ahead forecast for a four-day workweek test for software engineers says the chance is 55 out of 100 that staff resignations will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** It leaves room for the result not to happen, because 55% is a chance rather than a promise.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 5

Level 1

A month-ahead forecast for larger grocery unit-price labels says the chance is 60 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 6

Level 1

A month-ahead forecast for late fines on children's books says the chance is 65 out of 100 that library card renewals will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** Out of 100 cases like this, roughly 65 would be expected to improve.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 7

Level 1

A month-ahead forecast for two-factor login for site administrators says the chance is 70 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. A 70-out-of-100 chance means the result may happen, but it may not.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 8

Level 1

A month-ahead forecast for brighter streetlights on Maple Street says the chance is 75 out of 100 that reported thefts will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 9

Level 1

A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 80 out of 100 that course pass rates will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. About 80 of 100 similar situations would be expected to show the improvement.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 10

Level 1

A month-ahead forecast for calorie labels on restaurant menus says the chance is 85 out of 100 that dessert orders will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** This is a likelihood estimate: the result is possible, not certain.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 11

Level 1

A month-ahead forecast for bank overdraft warning texts says the chance is 90 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** In many similar cases, the improvement would happen about 90 out of 100 times.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 12

Level 1

A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 15 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** If there were 100 similar forecasts, about 15 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 13

Level 1

A month-ahead forecast for free Friday museum admission says the chance is 35 out of 100 that family visits will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 14

Level 1

A month-ahead forecast for youth soccer concussion checks says the chance is 45 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. It leaves room for the result not to happen, because 45% is a chance rather than a promise.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 15

Level 1

A month-ahead forecast for same-day donation receipts says the chance is 50 out of 100 that donor retention will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The number estimates how often this improvement would happen across many similar cases.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 16

Level 1

A month-ahead forecast for warehouse ergonomic training says the chance is 20 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** Out of 100 cases like this, roughly 20 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 17

Level 1

A month-ahead forecast for apartment-lobby compost bins says the chance is 25 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** A 25-out-of-100 chance means the result may happen, but it may not.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 18

Level 1

A month-ahead forecast for private-by-default app profiles says the chance is 30 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 19

Level 1

A month-ahead forecast for same-day clinic appointment slots says the chance is 40 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** About 40 of 100 similar situations would be expected to show the improvement.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 20

Level 1

A month-ahead forecast for seat-zone airline boarding says the chance is 55 out of 100 that average boarding time will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. This is a likelihood estimate: the result is possible, not certain.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 21

Level 1

A month-ahead forecast for an online apartment repair portal says the chance is 60 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 60 out of 100 times.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 22

Level 1

A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 65 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** If there were 100 similar forecasts, about 65 would be expected to improve.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 23

Level 1

A month-ahead forecast for weekly call-center script coaching says the chance is 70 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast says improvement is possible but not guaranteed: about 70 chances in 100.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 24

Level 1

A month-ahead forecast for household water-leak alerts says the chance is 75 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** It leaves room for the result not to happen, because 75% is a chance rather than a promise.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 25

Level 1

A month-ahead forecast for body-camera activation reminders says the chance is 80 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The number estimates how often this improvement would happen across many similar cases.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 26

Level 1

A month-ahead forecast for county mail-ballot tracking says the chance is 85 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. Out of 100 cases like this, roughly 85 would be expected to improve.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 27

Level 1

A month-ahead forecast for language-learning spaced-review prompts says the chance is 90 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. A 90-out-of-100 chance means the result may happen, but it may not.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 28

Level 1

A month-ahead forecast for a beginner gym orientation says the chance is 15 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The percentage describes a chance across repeated similar cases, not a promise for this one.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 29

Level 1

A month-ahead forecast for safe-driving feedback for policyholders says the chance is 35 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. About 35 of 100 similar situations would be expected to show the improvement.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 30

Level 1

A month-ahead forecast for top-of-article correction boxes says the chance is 45 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. This is a likelihood estimate: the result is possible, not certain.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 31

Level 1

A month-ahead forecast for clearer farmers market price signs says the chance is 50 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** In many similar cases, the improvement would happen about 50 out of 100 times.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 32

Level 1

A month-ahead forecast for hotel quiet-hours text reminders says the chance is 20 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. If there were 100 similar forecasts, about 20 would be expected to improve.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

A month-ahead forecast for evening bus service for late-shift workers says the chance is 30 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** If there were 100 similar forecasts, about 30 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 34

Level 2

A month-ahead forecast for classroom phone lockers says the chance is 40 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 35

Level 2

A month-ahead forecast for medication reminder texts for older patients says the chance is 55 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** It leaves room for the result not to happen, because 55% is a chance rather than a promise.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 36

Level 2

A month-ahead forecast for a four-day workweek test for software engineers says the chance is 60 out of 100 that staff resignations will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 37

Level 2

A month-ahead forecast for larger grocery unit-price labels says the chance is 65 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** Out of 100 cases like this, roughly 65 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 38

Level 2

A month-ahead forecast for late fines on children's books says the chance is 70 out of 100 that library card renewals will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. A 70-out-of-100 chance means the result may happen, but it may not.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 39

Level 2

A month-ahead forecast for two-factor login for site administrators says the chance is 75 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The percentage describes a chance across repeated similar cases, not a promise for this one.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 40

Level 2

A month-ahead forecast for brighter streetlights on Maple Street says the chance is 80 out of 100 that reported thefts will fall. What does that percentage mean?

A. About 80 of 100 similar situations would be expected to show the improvement.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 41

Level 2

A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 85 out of 100 that course pass rates will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** This is a likelihood estimate: the result is possible, not certain.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 42

Level 2

A month-ahead forecast for calorie labels on restaurant menus says the chance is 90 out of 100 that dessert orders will fall. What does that percentage mean?

A. In many similar cases, the improvement would happen about 90 out of 100 times.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 43

Level 2

A month-ahead forecast for bank overdraft warning texts says the chance is 15 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. If there were 100 similar forecasts, about 15 would be expected to improve.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 44

Level 2

A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 35 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 45

Level 2

A month-ahead forecast for free Friday museum admission says the chance is 45 out of 100 that family visits will rise. What does that percentage mean?

A. It leaves room for the result not to happen, because 45% is a chance rather than a promise.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 46

Level 2

A month-ahead forecast for youth soccer concussion checks says the chance is 50 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The number estimates how often this improvement would happen across many similar cases.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 47

Level 2

A month-ahead forecast for same-day donation receipts says the chance is 20 out of 100 that donor retention will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. Out of 100 cases like this, roughly 20 would be expected to improve.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 48

Level 2

A month-ahead forecast for warehouse ergonomic training says the chance is 25 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** A 25-out-of-100 chance means the result may happen, but it may not.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 49

Level 2

A month-ahead forecast for apartment-lobby compost bins says the chance is 30 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The percentage describes a chance across repeated similar cases, not a promise for this one.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 50

Level 2

A month-ahead forecast for private-by-default app profiles says the chance is 40 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** About 40 of 100 similar situations would be expected to show the improvement.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 51

Level 2

A month-ahead forecast for same-day clinic appointment slots says the chance is 55 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. This is a likelihood estimate: the result is possible, not certain.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 52

Level 2

A month-ahead forecast for seat-zone airline boarding says the chance is 60 out of 100 that average boarding time will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** In many similar cases, the improvement would happen about 60 out of 100 times.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 53

Level 2

A month-ahead forecast for an online apartment repair portal says the chance is 65 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** If there were 100 similar forecasts, about 65 would be expected to improve.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 54

Level 2

A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 70 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast says improvement is possible but not guaranteed: about 70 chances in 100.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 55

Level 2

A month-ahead forecast for weekly call-center script coaching says the chance is 75 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** It leaves room for the result not to happen, because 75% is a chance rather than a promise.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 56

Level 2

A month-ahead forecast for household water-leak alerts says the chance is 80 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The number estimates how often this improvement would happen across many similar cases.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 57

Level 2

A month-ahead forecast for body-camera activation reminders says the chance is 85 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** Out of 100 cases like this, roughly 85 would be expected to improve.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 58

Level 2

A month-ahead forecast for county mail-ballot tracking says the chance is 90 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. A 90-out-of-100 chance means the result may happen, but it may not.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 59

Level 2

A month-ahead forecast for language-learning spaced-review prompts says the chance is 15 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 60

Level 2

A month-ahead forecast for a beginner gym orientation says the chance is 35 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. About 35 of 100 similar situations would be expected to show the improvement.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 61

Level 2

A month-ahead forecast for safe-driving feedback for policyholders says the chance is 45 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** This is a likelihood estimate: the result is possible, not certain.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 62

Level 2

A month-ahead forecast for top-of-article correction boxes says the chance is 50 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. In many similar cases, the improvement would happen about 50 out of 100 times.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 63

Level 2

A month-ahead forecast for clearer farmers market price signs says the chance is 20 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. If there were 100 similar forecasts, about 20 would be expected to improve.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 64

Level 2

A month-ahead forecast for hotel quiet-hours text reminders says the chance is 25 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast says improvement is possible but not guaranteed: about 25 chances in 100.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

A month-ahead forecast for evening bus service for late-shift workers says the chance is 40 out of 100 that late-shift commute complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast says improvement is possible but not guaranteed: about 40 chances in 100.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 66

Level 3

A month-ahead forecast for classroom phone lockers says the chance is 55 out of 100 that classroom disruption reports will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** It leaves room for the result not to happen, because 55% is a chance rather than a promise.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 67

Level 3

A month-ahead forecast for medication reminder texts for older patients says the chance is 60 out of 100 that missed-dose reports will fall. What does that percentage mean?

A. The number estimates how often this improvement would happen across many similar cases.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 68

Level 3

A month-ahead forecast for a four-day workweek test for software engineers says the chance is 65 out of 100 that staff resignations will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** Out of 100 cases like this, roughly 65 would be expected to improve.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 69

Level 3

A month-ahead forecast for larger grocery unit-price labels says the chance is 70 out of 100 that shopper overpayment complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. A 70-out-of-100 chance means the result may happen, but it may not.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 70

Level 3

A month-ahead forecast for late fines on children's books says the chance is 75 out of 100 that library card renewals will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage describes a chance across repeated similar cases, not a promise for this one.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 71

Level 3

A month-ahead forecast for two-factor login for site administrators says the chance is 80 out of 100 that admin account takeovers will fall. What does that percentage mean?

A. About 80 of 100 similar situations would be expected to show the improvement.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 72

Level 3

A month-ahead forecast for brighter streetlights on Maple Street says the chance is 85 out of 100 that reported thefts will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** This is a likelihood estimate: the result is possible, not certain.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 73

Level 3

A month-ahead forecast for peer tutoring for first-year statistics students says the chance is 90 out of 100 that course pass rates will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. In many similar cases, the improvement would happen about 90 out of 100 times.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 74

Level 3

A month-ahead forecast for calorie labels on restaurant menus says the chance is 15 out of 100 that dessert orders will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** If there were 100 similar forecasts, about 15 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 75

Level 3

A month-ahead forecast for bank overdraft warning texts says the chance is 35 out of 100 that overdraft fees will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The forecast says improvement is possible but not guaranteed: about 35 chances in 100.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 76

Level 3

A month-ahead forecast for timed-entry passes for weekend park trails says the chance is 45 out of 100 that trail crowding complaints will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. It leaves room for the result not to happen, because 45% is a chance rather than a promise.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 77

Level 3

A month-ahead forecast for free Friday museum admission says the chance is 50 out of 100 that family visits will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The number estimates how often this improvement would happen across many similar cases.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 78

Level 3

A month-ahead forecast for youth soccer concussion checks says the chance is 20 out of 100 that repeat head injuries will fall. What does that percentage mean?

A. Out of 100 cases like this, roughly 20 would be expected to improve.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 79

Level 3

A month-ahead forecast for same-day donation receipts says the chance is 25 out of 100 that donor retention will rise. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** A 25-out-of-100 chance means the result may happen, but it may not.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 80

Level 3

A month-ahead forecast for warehouse ergonomic training says the chance is 30 out of 100 that back-injury claims will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage describes a chance across repeated similar cases, not a promise for this one.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 81

Level 3

A month-ahead forecast for apartment-lobby compost bins says the chance is 40 out of 100 that landfill waste from participating buildings will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** About 40 of 100 similar situations would be expected to show the improvement.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 82

Level 3

A month-ahead forecast for private-by-default app profiles says the chance is 55 out of 100 that publicly visible profiles will fall. What does that percentage mean?

A. This is a likelihood estimate: the result is possible, not certain.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 83

Level 3

A month-ahead forecast for same-day clinic appointment slots says the chance is 60 out of 100 that patient no-show rates will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** In many similar cases, the improvement would happen about 60 out of 100 times.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 84

Level 3

A month-ahead forecast for seat-zone airline boarding says the chance is 65 out of 100 that average boarding time will fall. What does that percentage mean?

A. If there were 100 similar forecasts, about 65 would be expected to improve.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The forecast should be ignored unless it says the chance is 100%.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

Question 85

Level 3

A month-ahead forecast for an online apartment repair portal says the chance is 70 out of 100 that unresolved repair requests will fall. What does that percentage mean?

A. The forecast says improvement is possible but not guaranteed: about 70 chances in 100.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 86

Level 3

A month-ahead forecast for fruit placement in a school cafeteria line says the chance is 75 out of 100 that fruit purchases will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** It leaves room for the result not to happen, because 75% is a chance rather than a promise.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 87

Level 3

A month-ahead forecast for weekly call-center script coaching says the chance is 80 out of 100 that customer complaint rates will fall. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The number estimates how often this improvement would happen across many similar cases.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 88

Level 3

A month-ahead forecast for household water-leak alerts says the chance is 85 out of 100 that average household water use will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage tells how many people support the plan, not how likely the result is.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** Out of 100 cases like this, roughly 85 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. The percentage is about likelihood, not popularity or approval.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 89

Level 3

A month-ahead forecast for body-camera activation reminders says the chance is 90 out of 100 that missing-camera-footage reports will fall. What does that percentage mean?

A. A 90-out-of-100 chance means the result may happen, but it may not.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 90

Level 3

A month-ahead forecast for county mail-ballot tracking says the chance is 15 out of 100 that phone calls asking ballot status will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The percentage describes a chance across repeated similar cases, not a promise for this one.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 91

Level 3

A month-ahead forecast for language-learning spaced-review prompts says the chance is 35 out of 100 that vocabulary retention quiz scores will rise. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. About 35 of 100 similar situations would be expected to show the improvement.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 92

Level 3

A month-ahead forecast for a beginner gym orientation says the chance is 45 out of 100 that new-member cancellations will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** This is a likelihood estimate: the result is possible, not certain.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 93

Level 3

A month-ahead forecast for safe-driving feedback for policyholders says the chance is 50 out of 100 that reported minor crashes will fall. What does that percentage mean?

A. The forecast promises what will happen in this one case, so no other result should be expected.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. In many similar cases, the improvement would happen about 50 out of 100 times.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Question 94

Level 3

A month-ahead forecast for top-of-article correction boxes says the chance is 20 out of 100 that reader trust ratings will rise. What does that percentage mean?

A. The percentage tells how many people support the plan, not how likely the result is.	**B.** The forecast promises what will happen in this one case, so no other result should be expected.
C. The forecast should be ignored unless it says the chance is 100%.	**D.** If there were 100 similar forecasts, about 20 would be expected to improve.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. The percentage is about likelihood, not popularity or approval.

B. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

C. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 95

Level 3

A month-ahead forecast for clearer farmers market price signs says the chance is 25 out of 100 that price disputes will fall. What does that percentage mean?

A. The forecast should be ignored unless it says the chance is 100%.	**B.** The forecast says improvement is possible but not guaranteed: about 25 chances in 100.
C. The percentage tells how many people support the plan, not how likely the result is.	**D.** The forecast promises what will happen in this one case, so no other result should be expected.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. The percentage is about likelihood, not popularity or approval.

D. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

Question 96

Level 3

A month-ahead forecast for hotel quiet-hours text reminders says the chance is 30 out of 100 that noise complaints from guest rooms will fall. What does that percentage mean?

A. It leaves room for the result not to happen, because 30% is a chance rather than a promise.	**B.** The forecast should be ignored unless it says the chance is 100%.
C. The forecast promises what will happen in this one case, so no other result should be expected.	**D.** The percentage tells how many people support the plan, not how likely the result is.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A forecast below 100% can still be useful. Probability is not all-or-nothing.

C. Not correct. A forecast gives a chance, not a promise about the single case in front of you.

D. Not correct. The percentage is about likelihood, not popularity or approval.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

A screening tool connected to evening bus service for late-shift workers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Take the signal seriously, but ask how often this kind of tool is wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 98

Level 4

A screening tool connected to classroom phone lockers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm.	**B.** Ignore the signal because some signals are wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 99

Level 4

A screening tool connected to medication reminder texts for older patients flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Use the signal as a reason to check further, not as proof that the problem is there.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 100

Level 4

A screening tool connected to a four-day workweek test for software engineers flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 101

Level 4

A screening tool connected to larger grocery unit-price labels flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** See the signal as evidence to investigate, while remembering that it is not certainty.
C. Ignore the signal because some signals are wrong.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 102

Level 4

A screening tool connected to late fines on children's books flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 103

Level 4

A screening tool connected to two-factor login for site administrators flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Update cautiously because a positive signal can still turn out to be a false alarm.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 104

Level 4

A screening tool connected to brighter streetlights on Maple Street flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Use the signal as a reason to check further, not as proof that the problem is there.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 105

Level 4

A screening tool connected to peer tutoring for first-year statistics students flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Check the base rate and false-alarm rate before treating the signal as strong evidence.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 106

Level 4

A screening tool connected to calorie labels on restaurant menus flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. See the signal as evidence to investigate, while remembering that it is not certainty.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 107

Level 4

A screening tool connected to bank overdraft warning texts flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Take the signal seriously, but ask how often this kind of tool is wrong.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 108

Level 4

A screening tool connected to timed-entry passes for weekend park trails flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Ignore the signal because some signals are wrong.	**D.** Update cautiously because a positive signal can still turn out to be a false alarm.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 109

Level 4

A screening tool connected to free Friday museum admission flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Use the signal as a reason to check further, not as proof that the problem is there.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 110

Level 4

A screening tool connected to youth soccer concussion checks flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Check the base rate and false-alarm rate before treating the signal as strong evidence.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 111

Level 4

A screening tool connected to same-day donation receipts flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. See the signal as evidence to investigate, while remembering that it is not certainty.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 112

Level 4

A screening tool connected to warehouse ergonomic training flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Take the signal seriously, but ask how often this kind of tool is wrong.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 113

Level 4

A screening tool connected to apartment-lobby compost bins flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm.	**B.** Ignore the signal because some signals are wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 114

Level 4

A screening tool connected to private-by-default app profiles flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Use the signal as a reason to check further, not as proof that the problem is there.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 115

Level 4

A screening tool connected to same-day clinic appointment slots flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**B.** Ignore the signal because some signals are wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 116

Level 4

A screening tool connected to seat-zone airline boarding flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. See the signal as evidence to investigate, while remembering that it is not certainty.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 117

Level 4

A screening tool connected to an online apartment repair portal flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Ignore the signal because some signals are wrong.	**D.** Take the signal seriously, but ask how often this kind of tool is wrong.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 118

Level 4

A screening tool connected to fruit placement in a school cafeteria line flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Update cautiously because a positive signal can still turn out to be a false alarm.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 119

Level 4

A screening tool connected to weekly call-center script coaching flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Use the signal as a reason to check further, not as proof that the problem is there.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 120

Level 4

A screening tool connected to household water-leak alerts flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Ignore the signal because some signals are wrong.
C. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 121

Level 4

A screening tool connected to body-camera activation reminders flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** See the signal as evidence to investigate, while remembering that it is not certainty.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 122

Level 4

A screening tool connected to county mail-ballot tracking flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Take the signal seriously, but ask how often this kind of tool is wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 123

Level 4

A screening tool connected to language-learning spaced-review prompts flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Update cautiously because a positive signal can still turn out to be a false alarm.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 124

Level 4

A screening tool connected to a beginner gym orientation flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Use the signal as a reason to check further, not as proof that the problem is there.
C. Ignore the signal because some signals are wrong.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 125

Level 4

A screening tool connected to safe-driving feedback for policyholders flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Ignore the signal because some signals are wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Check the base rate and false-alarm rate before treating the signal as strong evidence.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 126

Level 4

A screening tool connected to top-of-article correction boxes flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Ignore the signal because some signals are wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. See the signal as evidence to investigate, while remembering that it is not certainty.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 127

Level 4

A screening tool connected to clearer farmers market price signs flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 128

Level 4

A screening tool connected to hotel quiet-hours text reminders flags possible problems. It catches many real problems, but it also gives false alarms. The problem is uncommon in the group being screened. What is the best way to treat a positive signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Update cautiously because a positive signal can still turn out to be a false alarm.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

A screening tool connected to evening bus service for late-shift workers gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm.	**B.** Ignore the signal because some signals are wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 130

Level 5

A screening tool connected to classroom phone lockers gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Use the signal as a reason to check further, not as proof that the problem is there.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 131

Level 5

A screening tool connected to medication reminder texts for older patients gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Ignore the signal because some signals are wrong.
C. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 132

Level 5

A screening tool connected to a four-day workweek test for software engineers gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Ignore the signal because some signals are wrong.	**D.** See the signal as evidence to investigate, while remembering that it is not certainty.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 133

Level 5

A screening tool connected to larger grocery unit-price labels gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 134

Level 5

A screening tool connected to late fines on children's books gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Update cautiously because a positive signal can still turn out to be a false alarm.
C. Ignore the signal because some signals are wrong.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 135

Level 5

A screening tool connected to two-factor login for site administrators gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Ignore the signal because some signals are wrong.
C. Use the signal as a reason to check further, not as proof that the problem is there.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 136

Level 5

A screening tool connected to brighter streetlights on Maple Street gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Check the base rate and false-alarm rate before treating the signal as strong evidence.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 137

Level 5

A screening tool connected to peer tutoring for first-year statistics students gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. See the signal as evidence to investigate, while remembering that it is not certainty.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 138

Level 5

A screening tool connected to calorie labels on restaurant menus gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Ignore the signal because some signals are wrong.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Take the signal seriously, but ask how often this kind of tool is wrong.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 139

Level 5

A screening tool connected to bank overdraft warning texts gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Update cautiously because a positive signal can still turn out to be a false alarm.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 140

Level 5

A screening tool connected to timed-entry passes for weekend park trails gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Ignore the signal because some signals are wrong.	**D.** Use the signal as a reason to check further, not as proof that the problem is there.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 141

Level 5

A screening tool connected to free Friday museum admission gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Check the base rate and false-alarm rate before treating the signal as strong evidence.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 142

Level 5

A screening tool connected to youth soccer concussion checks gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. See the signal as evidence to investigate, while remembering that it is not certainty.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 143

Level 5

A screening tool connected to same-day donation receipts gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Take the signal seriously, but ask how often this kind of tool is wrong.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 144

Level 5

A screening tool connected to warehouse ergonomic training gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Update cautiously because a positive signal can still turn out to be a false alarm.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 145

Level 5

A screening tool connected to apartment-lobby compost bins gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Use the signal as a reason to check further, not as proof that the problem is there.
C. Ignore the signal because some signals are wrong.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 146

Level 5

A screening tool connected to private-by-default app profiles gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Ignore the signal because some signals are wrong.	**D.** Look only at the positive signal and ignore how common the problem is in the first place.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

Question 147

Level 5

A screening tool connected to same-day clinic appointment slots gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** See the signal as evidence to investigate, while remembering that it is not certainty.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 148

Level 5

A screening tool connected to seat-zone airline boarding gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Take the signal seriously, but ask how often this kind of tool is wrong.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 149

Level 5

A screening tool connected to an online apartment repair portal gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Update cautiously because a positive signal can still turn out to be a false alarm.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Ignore the signal because some signals are wrong.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 150

Level 5

A screening tool connected to fruit placement in a school cafeteria line gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Use the signal as a reason to check further, not as proof that the problem is there.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 151

Level 5

A screening tool connected to weekly call-center script coaching gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Check the base rate and false-alarm rate before treating the signal as strong evidence.	**D.** Ignore the signal because some signals are wrong.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 152

Level 5

A screening tool connected to household water-leak alerts gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Treat the signal as strong enough to act on without any follow-up check.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** See the signal as evidence to investigate, while remembering that it is not certainty.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 153

Level 5

A screening tool connected to body-camera activation reminders gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Take the signal seriously, but ask how often this kind of tool is wrong.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 154

Level 5

A screening tool connected to county mail-ballot tracking gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Update cautiously because a positive signal can still turn out to be a false alarm.

Answer: D. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is D because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

Question 155

Level 5

A screening tool connected to language-learning spaced-review prompts gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Use the signal as a reason to check further, not as proof that the problem is there.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. Ignore the signal because some signals are wrong.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 156

Level 5

A screening tool connected to a beginner gym orientation gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Check the base rate and false-alarm rate before treating the signal as strong evidence.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 157

Level 5

A screening tool connected to safe-driving feedback for policyholders gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Ignore the signal because some signals are wrong.	**B.** Look only at the positive signal and ignore how common the problem is in the first place.
C. See the signal as evidence to investigate, while remembering that it is not certainty.	**D.** Treat the signal as strong enough to act on without any follow-up check.

Answer: C. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is C because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

B. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

C. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

D. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

Question 158

Level 5

A screening tool connected to top-of-article correction boxes gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Take the signal seriously, but ask how often this kind of tool is wrong.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 159

Level 5

A screening tool connected to clearer farmers market price signs gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Look only at the positive signal and ignore how common the problem is in the first place.	**B.** Update cautiously because a positive signal can still turn out to be a false alarm.
C. Treat the signal as strong enough to act on without any follow-up check.	**D.** Ignore the signal because some signals are wrong.

Answer: B. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is B because it treats the number or signal as useful evidence while preserving uncertainty.

A. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

B. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

C. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Question 160

Level 5

A screening tool connected to hotel quiet-hours text reminders gives a positive signal for one case. The tool catches many real problems, but false alarms are common, and only a small share of cases have the problem. What is the best way to treat that signal?

A. Use the signal as a reason to check further, not as proof that the problem is there.	**B.** Treat the signal as strong enough to act on without any follow-up check.
C. Look only at the positive signal and ignore how common the problem is in the first place.	**D.** Ignore the signal because some signals are wrong.

Answer: A. Probability is about chance and uncertainty, not guarantees.

How to work it out. To uncover the answer, keep chance separate from certainty. The correct choice is A because it treats the number or signal as useful evidence while preserving uncertainty.

A. Correct. This answer treats the number or signal as uncertain evidence. Probability gives a chance or reason to check further, not a guarantee.

B. Not correct. A positive signal can be wrong, so it calls for follow-up rather than automatic action.

C. Not correct. Base rates matter. A signal means more when the problem is common than when it is rare.

D. Not correct. False alarms mean the signal is not proof, but they do not mean the signal should be ignored.

Skill 11

Use Statistical Sense

What Do the Numbers Say?

Read numbers with the right context. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	What does this number mean in context?
Why it matters	Numbers can clarify, but they can also mislead when people ignore denominators, baselines, rates, averages, or the difference between percent and percentage points.
Conceptual core	Statistical sense keeps numbers connected to their denominators, baselines, units, and comparisons. Students should learn that a precise number can still be misleading if the reference point is missing. The central habits are asking compared with what, out of how many, measured how, and over what time period. The goal is not advanced math; it is disciplined interpretation.
Student method	Ask what is being counted, what it is being compared with, and what the denominator is. Never let a large raw number outrun the size of the group it came from.
Analogy	Statistics are like a scale. If you do not know the units or the zero point, the reading can look precise while meaning very little.
Assessment focus	A good answer identifies the missing or correct numerical context: baseline, denominator, comparison group, unit, or time period.

Teaching Sequence

1. Identify the numerator and denominator behind a rate.

2. Ask what the number is being compared with.

3. Separate percent change from percentage-point change.

4. Check whether averages, totals, or selected examples hide variation.

Common Confusions To Watch For

1. Students may think a bigger raw count always means a bigger rate.

2. Students may treat a percentage change as clear without knowing the starting value.

3. Students may ignore whether the comparison groups are the same size.

Teacher Prompts

1. Out of how many?

2. Compared with what baseline?

3. Is this a total, rate, average, percentage, or percentage-point change?

Worked Example

Scenario	A clinic says missed appointments fell by 20 percent after reminder texts, from 100 missed visits per month to 80.
Teacher think-aloud	The 20 percent has a reference point: 20 fewer missed visits compared with the earlier 100. Without the before number, the change would be harder to judge.
Student takeaway	Numbers become meaningful when the comparison and denominator are visible.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A clinic had 100 missed appointments out of 1,000 booked visits in March and 80 out of 800 in April. It advertises: 'Missed appointments fell by 20%, so patients became more reliable.'

What To Do

1. Calculate the percentage change in the number missed: (80 - 100) / 100 x 100.

2. Calculate each month's missed-appointment rate: missed / booked x 100.

3. Write two sentences separating what changed in the count from what changed in the rate, and judge whether the reliability claim follows from these figures.

Check before reading the answer. Did you name the denominator for each month? A lower count does not necessarily mean a lower rate.

Model Answer

The missed count fell by 20%. March's rate is 100/1,000 = 10%; April's is 80/800 = 10%. Fewer appointments were missed, but the proportion missed stayed the same. These figures do not support an improvement in reliability measured by that rate.

Why it is adequate. It calculates both quantities and prevents a true statement about a count from becoming an unsupported statement about a rate.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

In a study about evening bus service for late-shift workers, the tracked outcome is late-shift commute complaints. Group A recorded 5 outcome events in 100 observations. Group B recorded 7 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 7 events is more than 5 events, so the raw count must decide the rate.	**D.** Group A, because 5/100 is a higher rate than 7/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 2

Level 1

In a study about classroom phone lockers, the tracked outcome is classroom disruption reports. Group A recorded 8 outcome events in 300 observations. Group B recorded 6 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 8 events is more than 6 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 3

Level 1

In a study about medication reminder texts for older patients, the tracked outcome is missed-dose reports. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 9 events is more than 7 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 4

Level 1

In a study about a four-day workweek test for software engineers, the tracked outcome is staff resignations. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**B.** Group A, because 10 events is more than 8 events, so the raw count must decide the rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 5

Level 1

In a study about larger grocery unit-price labels, the tracked outcome is shopper overpayment complaints. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 11 events is more than 9 events, so the raw count must decide the rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 6

Level 1

In a study about late fines on children's books, the tracked outcome is library card renewals. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**D.** Group A, because 12 events is more than 10 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 7

Level 1

In a study about two-factor login for site administrators, the tracked outcome is admin account takeovers. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 13 events is more than 11 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 8

Level 1

In a study about brighter streetlights on Maple Street, the tracked outcome is reported thefts. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 14 events is more than 12 events, so the raw count must decide the rate.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 9

Level 1

In a study about peer tutoring for first-year statistics students, the tracked outcome is course pass rates. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 6 events is more than 4 events, so the raw count must decide the rate.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 10

Level 1

In a study about calorie labels on restaurant menus, the tracked outcome is dessert orders. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 7 events is more than 5 events, so the raw count must decide the rate.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 11

Level 1

In a study about bank overdraft warning texts, the tracked outcome is overdraft fees. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 8 events is more than 6 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 12

Level 1

In a study about timed-entry passes for weekend park trails, the tracked outcome is trail crowding complaints. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 13

Level 1

In a study about free Friday museum admission, the tracked outcome is family visits. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. Group B, because 10 events is more than 8 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 14

Level 1

In a study about youth soccer concussion checks, the tracked outcome is repeat head injuries. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 11 events is more than 9 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 15

Level 1

In a study about same-day donation receipts, the tracked outcome is donor retention. Group A recorded 10 outcome events in 100 observations. Group B recorded 12 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 16

Level 1

In a study about warehouse ergonomic training, the tracked outcome is back-injury claims. Group A recorded 13 outcome events in 300 observations. Group B recorded 11 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. Group B, because 11/100 is a higher rate than 13/300; compare rates, not just counts.	**D.** Group A, because 13 events is more than 11 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 17

Level 1

In a study about apartment-lobby compost bins, the tracked outcome is landfill waste from participating buildings. Group A recorded 12 outcome events in 100 observations. Group B recorded 14 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 12/100 is a higher rate than 14/300; compare rates, not just counts.	**B.** Group B, because 14 events is more than 12 events, so the raw count must decide the rate.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 18

Level 1

In a study about private-by-default app profiles, the tracked outcome is publicly visible profiles. Group A recorded 6 outcome events in 300 observations. Group B recorded 4 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 4/100 is a higher rate than 6/300; compare rates, not just counts.	**D.** Group A, because 6 events is more than 4 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 19

Level 1

In a study about same-day clinic appointment slots, the tracked outcome is patient no-show rates. Group A recorded 5 outcome events in 100 observations. Group B recorded 7 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group B, because 7 events is more than 5 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 20

Level 1

In a study about seat-zone airline boarding, the tracked outcome is average boarding time. Group A recorded 8 outcome events in 300 observations. Group B recorded 6 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 8 events is more than 6 events, so the raw count must decide the rate.
C. Group B, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 21

Level 1

In a study about an online apartment repair portal, the tracked outcome is unresolved repair requests. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 9 events is more than 7 events, so the raw count must decide the rate.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 22

Level 1

In a study about fruit placement in a school cafeteria line, the tracked outcome is fruit purchases. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 10 events is more than 8 events, so the raw count must decide the rate.	**B.** Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 23

Level 1

In a study about weekly call-center script coaching, the tracked outcome is customer complaint rates. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 11 events is more than 9 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 24

Level 1

In a study about household water-leak alerts, the tracked outcome is average household water use. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 12 events is more than 10 events, so the raw count must decide the rate.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 25

Level 1

In a study about body-camera activation reminders, the tracked outcome is missing-camera-footage reports. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 13 events is more than 11 events, so the raw count must decide the rate.	**D.** Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 26

Level 1

In a study about county mail-ballot tracking, the tracked outcome is phone calls asking ballot status. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 14 events is more than 12 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 27

Level 1

In a study about language-learning spaced-review prompts, the tracked outcome is vocabulary retention quiz scores. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 28

Level 1

In a study about a beginner gym orientation, the tracked outcome is new-member cancellations. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 7 events is more than 5 events, so the raw count must decide the rate.	**B.** Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 29

Level 1

In a study about safe-driving feedback for policyholders, the tracked outcome is reported minor crashes. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.
C. Group B, because 8 events is more than 6 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 30

Level 1

In a study about top-of-article correction boxes, the tracked outcome is reader trust ratings. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 9 events is more than 7 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 31

Level 1

In a study about clearer farmers market price signs, the tracked outcome is price disputes. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 10 events is more than 8 events, so the raw count must decide the rate.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 32

Level 1

In a study about hotel quiet-hours text reminders, the tracked outcome is noise complaints from guest rooms. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.
C. Group A, because 11 events is more than 9 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

In a study about evening bus service for late-shift workers, the tracked outcome is late-shift commute complaints. Group A recorded 8 outcome events in 300 observations. Group B recorded 6 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 8 events is more than 6 events, so the raw count must decide the rate.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group B, because 6/100 is a higher rate than 8/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 34

Level 2

In a study about classroom phone lockers, the tracked outcome is classroom disruption reports. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**B.** Group B, because 9 events is more than 7 events, so the raw count must decide the rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 35

Level 2

In a study about medication reminder texts for older patients, the tracked outcome is missed-dose reports. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.
C. Group A, because 10 events is more than 8 events, so the raw count must decide the rate.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 36

Level 2

In a study about a four-day workweek test for software engineers, the tracked outcome is staff resignations. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 11 events is more than 9 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 37

Level 2

In a study about larger grocery unit-price labels, the tracked outcome is shopper overpayment complaints. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 38

Level 2

In a study about late fines on children's books, the tracked outcome is library card renewals. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.	**B.** Group B, because 13 events is more than 11 events, so the raw count must decide the rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 39

Level 2

In a study about two-factor login for site administrators, the tracked outcome is admin account takeovers. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.
C. Group A, because 14 events is more than 12 events, so the raw count must decide the rate.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 40

Level 2

In a study about brighter streetlights on Maple Street, the tracked outcome is reported thefts. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.	**D.** Group B, because 6 events is more than 4 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 41

Level 2

In a study about peer tutoring for first-year statistics students, the tracked outcome is course pass rates. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.
C. Group A, because 7 events is more than 5 events, so the raw count must decide the rate.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 42

Level 2

In a study about calorie labels on restaurant menus, the tracked outcome is dessert orders. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 43

Level 2

In a study about bank overdraft warning texts, the tracked outcome is overdraft fees. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 9 events is more than 7 events, so the raw count must decide the rate.
C. Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 44

Level 2

In a study about timed-entry passes for weekend park trails, the tracked outcome is trail crowding complaints. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 10 events is more than 8 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 45

Level 2

In a study about free Friday museum admission, the tracked outcome is family visits. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 11 events is more than 9 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 46

Level 2

In a study about youth soccer concussion checks, the tracked outcome is repeat head injuries. Group A recorded 10 outcome events in 100 observations. Group B recorded 12 outcome events in 300 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 10/100 is a higher rate than 12/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 47

Level 2

In a study about same-day donation receipts, the tracked outcome is donor retention. Group A recorded 13 outcome events in 300 observations. Group B recorded 11 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group A, because 13 events is more than 11 events, so the raw count must decide the rate.
C. Group B, because 11/100 is a higher rate than 13/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 48

Level 2

In a study about warehouse ergonomic training, the tracked outcome is back-injury claims. Group A recorded 12 outcome events in 100 observations. Group B recorded 14 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 12/100 is a higher rate than 14/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 49

Level 2

In a study about apartment-lobby compost bins, the tracked outcome is landfill waste from participating buildings. Group A recorded 6 outcome events in 300 observations. Group B recorded 4 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 4/100 is a higher rate than 6/300; compare rates, not just counts.	**B.** Group A, because 6 events is more than 4 events, so the raw count must decide the rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 50

Level 2

In a study about private-by-default app profiles, the tracked outcome is publicly visible profiles. Group A recorded 5 outcome events in 100 observations. Group B recorded 7 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 7 events is more than 5 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 5/100 is a higher rate than 7/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 51

Level 2

In a study about same-day clinic appointment slots, the tracked outcome is patient no-show rates. Group A recorded 8 outcome events in 300 observations. Group B recorded 6 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. Group A, because 8 events is more than 6 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 52

Level 2

In a study about seat-zone airline boarding, the tracked outcome is average boarding time. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. Group B, because 9 events is more than 7 events, so the raw count must decide the rate.	**D.** Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 53

Level 2

In a study about an online apartment repair portal, the tracked outcome is unresolved repair requests. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 10 events is more than 8 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 54

Level 2

In a study about fruit placement in a school cafeteria line, the tracked outcome is fruit purchases. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 11 events is more than 9 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 55

Level 2

In a study about weekly call-center script coaching, the tracked outcome is customer complaint rates. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 56

Level 2

In a study about household water-leak alerts, the tracked outcome is average household water use. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 13 events is more than 11 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 57

Level 2

In a study about body-camera activation reminders, the tracked outcome is missing-camera-footage reports. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 14 events is more than 12 events, so the raw count must decide the rate.	**B.** Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 58

Level 2

In a study about county mail-ballot tracking, the tracked outcome is phone calls asking ballot status. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group B, because 6 events is more than 4 events, so the raw count must decide the rate.
C. Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 59

Level 2

In a study about language-learning spaced-review prompts, the tracked outcome is vocabulary retention quiz scores. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**B.** Group A, because 7 events is more than 5 events, so the raw count must decide the rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 60

Level 2

In a study about a beginner gym orientation, the tracked outcome is new-member cancellations. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 8 events is more than 6 events, so the raw count must decide the rate.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 61

Level 2

In a study about safe-driving feedback for policyholders, the tracked outcome is reported minor crashes. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 9 events is more than 7 events, so the raw count must decide the rate.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 62

Level 2

In a study about top-of-article correction boxes, the tracked outcome is reader trust ratings. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 10 events is more than 8 events, so the raw count must decide the rate.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 63

Level 2

In a study about clearer farmers market price signs, the tracked outcome is price disputes. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 11 events is more than 9 events, so the raw count must decide the rate.	**B.** Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 64

Level 2

In a study about hotel quiet-hours text reminders, the tracked outcome is noise complaints from guest rooms. Group A recorded 10 outcome events in 100 observations. Group B recorded 12 outcome events in 300 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 12 events is more than 10 events, so the raw count must decide the rate.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 10/100 is a higher rate than 12/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

In a study about evening bus service for late-shift workers, the tracked outcome is late-shift commute complaints. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 66

Level 3

In a study about classroom phone lockers, the tracked outcome is classroom disruption reports. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 10 events is more than 8 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 67

Level 3

In a study about medication reminder texts for older patients, the tracked outcome is missed-dose reports. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 68

Level 3

In a study about a four-day workweek test for software engineers, the tracked outcome is staff resignations. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**D.** Group A, because 12 events is more than 10 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 69

Level 3

In a study about larger grocery unit-price labels, the tracked outcome is shopper overpayment complaints. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 13 events is more than 11 events, so the raw count must decide the rate.	**B.** Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 70

Level 3

In a study about late fines on children's books, the tracked outcome is library card renewals. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.	**B.** Group A, because 14 events is more than 12 events, so the raw count must decide the rate.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 71

Level 3

In a study about two-factor login for site administrators, the tracked outcome is admin account takeovers. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 72

Level 3

In a study about brighter streetlights on Maple Street, the tracked outcome is reported thefts. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 7 events is more than 5 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**D.** Group A, because 300 observations is the larger group, so it must have the higher rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 73

Level 3

In a study about peer tutoring for first-year statistics students, the tracked outcome is course pass rates. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 8 events is more than 6 events, so the raw count must decide the rate.	**B.** Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 74

Level 3

In a study about calorie labels on restaurant menus, the tracked outcome is dessert orders. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**B.** Group A, because 9 events is more than 7 events, so the raw count must decide the rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** The raw counts are close enough that dividing by group size is unnecessary.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 75

Level 3

In a study about bank overdraft warning texts, the tracked outcome is overdraft fees. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 10 events is more than 8 events, so the raw count must decide the rate.	**B.** Group B, because 300 observations is the larger group, so it must have the higher rate.
C. Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 76

Level 3

In a study about timed-entry passes for weekend park trails, the tracked outcome is trail crowding complaints. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 77

Level 3

In a study about free Friday museum admission, the tracked outcome is family visits. Group A recorded 10 outcome events in 100 observations. Group B recorded 12 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 12 events is more than 10 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 78

Level 3

In a study about youth soccer concussion checks, the tracked outcome is repeat head injuries. Group A recorded 13 outcome events in 300 observations. Group B recorded 11 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group B, because 11/100 is a higher rate than 13/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 13 events is more than 11 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 79

Level 3

In a study about same-day donation receipts, the tracked outcome is donor retention. Group A recorded 12 outcome events in 100 observations. Group B recorded 14 outcome events in 300 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 14 events is more than 12 events, so the raw count must decide the rate.
C. Group A, because 12/100 is a higher rate than 14/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 80

Level 3

In a study about warehouse ergonomic training, the tracked outcome is back-injury claims. Group A recorded 6 outcome events in 300 observations. Group B recorded 4 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 6 events is more than 4 events, so the raw count must decide the rate.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group B, because 4/100 is a higher rate than 6/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 81

Level 3

In a study about apartment-lobby compost bins, the tracked outcome is landfill waste from participating buildings. Group A recorded 5 outcome events in 100 observations. Group B recorded 7 outcome events in 300 observations. Which group had the higher rate?

A. Group A, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 82

Level 3

In a study about private-by-default app profiles, the tracked outcome is publicly visible profiles. Group A recorded 8 outcome events in 300 observations. Group B recorded 6 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** Group B, because 6/100 is a higher rate than 8/300; compare rates, not just counts.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 8 events is more than 6 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 83

Level 3

In a study about same-day clinic appointment slots, the tracked outcome is patient no-show rates. Group A recorded 7 outcome events in 100 observations. Group B recorded 9 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**D.** Group B, because 9 events is more than 7 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 84

Level 3

In a study about seat-zone airline boarding, the tracked outcome is average boarding time. Group A recorded 10 outcome events in 300 observations. Group B recorded 8 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 10 events is more than 8 events, so the raw count must decide the rate.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 8/100 is a higher rate than 10/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 85

Level 3

In a study about an online apartment repair portal, the tracked outcome is unresolved repair requests. Group A recorded 9 outcome events in 100 observations. Group B recorded 11 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 11 events is more than 9 events, so the raw count must decide the rate.	**B.** Group A, because 9/100 is a higher rate than 11/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 300 observations is the larger group, so it must have the higher rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

Question 86

Level 3

In a study about fruit placement in a school cafeteria line, the tracked outcome is fruit purchases. Group A recorded 12 outcome events in 300 observations. Group B recorded 10 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 12 events is more than 10 events, so the raw count must decide the rate.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 87

Level 3

In a study about weekly call-center script coaching, the tracked outcome is customer complaint rates. Group A recorded 11 outcome events in 100 observations. Group B recorded 13 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group B, because 13 events is more than 11 events, so the raw count must decide the rate.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 11/100 is a higher rate than 13/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 88

Level 3

In a study about household water-leak alerts, the tracked outcome is average household water use. Group A recorded 14 outcome events in 300 observations. Group B recorded 12 outcome events in 100 observations. Which group had the higher rate?

A. Group A, because 300 observations is the larger group, so it must have the higher rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 12/100 is a higher rate than 14/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 89

Level 3

In a study about body-camera activation reminders, the tracked outcome is missing-camera-footage reports. Group A recorded 4 outcome events in 100 observations. Group B recorded 6 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 4/100 is a higher rate than 6/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group B, because 6 events is more than 4 events, so the raw count must decide the rate.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 90

Level 3

In a study about county mail-ballot tracking, the tracked outcome is phone calls asking ballot status. Group A recorded 7 outcome events in 300 observations. Group B recorded 5 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 5/100 is a higher rate than 7/300; compare rates, not just counts.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** Group A, because 7 events is more than 5 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 91

Level 3

In a study about language-learning spaced-review prompts, the tracked outcome is vocabulary retention quiz scores. Group A recorded 6 outcome events in 100 observations. Group B recorded 8 outcome events in 300 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group B, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group A, because 6/100 is a higher rate than 8/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 92

Level 3

In a study about a beginner gym orientation, the tracked outcome is new-member cancellations. Group A recorded 9 outcome events in 300 observations. Group B recorded 7 outcome events in 100 observations. Which group had the higher rate?

A. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**B.** Group A, because 300 observations is the larger group, so it must have the higher rate.
C. Group B, because 7/100 is a higher rate than 9/300; compare rates, not just counts.	**D.** Group A, because 9 events is more than 7 events, so the raw count must decide the rate.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

B. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 93

Level 3

In a study about safe-driving feedback for policyholders, the tracked outcome is reported minor crashes. Group A recorded 8 outcome events in 100 observations. Group B recorded 10 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 300 observations is the larger group, so it must have the higher rate.	**B.** Group A, because 8/100 is a higher rate than 10/300; compare rates, not just counts.
C. The raw counts are close enough that dividing by group size is unnecessary.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 94

Level 3

In a study about top-of-article correction boxes, the tracked outcome is reader trust ratings. Group A recorded 11 outcome events in 300 observations. Group B recorded 9 outcome events in 100 observations. Which group had the higher rate?

A. Group B, because 9/100 is a higher rate than 11/300; compare rates, not just counts.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. There is no fair way to compare rates when group sizes differ, even if both counts are given.	**D.** Group A, because 11 events is more than 9 events, so the raw count must decide the rate.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

D. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

Question 95

Level 3

In a study about clearer farmers market price signs, the tracked outcome is price disputes. Group A recorded 10 outcome events in 100 observations. Group B recorded 12 outcome events in 300 observations. Which group had the higher rate?

A. Group B, because 12 events is more than 10 events, so the raw count must decide the rate.	**B.** The raw counts are close enough that dividing by group size is unnecessary.
C. Group A, because 10/100 is a higher rate than 12/300; compare rates, not just counts.	**D.** There is no fair way to compare rates when group sizes differ, even if both counts are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

Question 96

Level 3

In a study about hotel quiet-hours text reminders, the tracked outcome is noise complaints from guest rooms. Group A recorded 13 outcome events in 300 observations. Group B recorded 11 outcome events in 100 observations. Which group had the higher rate?

A. The raw counts are close enough that dividing by group size is unnecessary.	**B.** There is no fair way to compare rates when group sizes differ, even if both counts are given.
C. Group A, because 300 observations is the larger group, so it must have the higher rate.	**D.** Group B, because 11/100 is a higher rate than 13/300; compare rates, not just counts.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Raw counts can mislead when group sizes differ. The fair comparison is the rate.

B. Not correct. Different group sizes are exactly when rates are useful; the counts and totals are enough to compare.

C. Not correct. A bigger group does not automatically have the higher rate. You still have to divide events by observations.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

A report about evening bus service for late-shift workers says late-shift commute complaints rose from 8% to 13% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It rose by 5 percentage points, which is about a 63% increase compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 98

Level 4

A report about classroom phone lockers says classroom disruption reports fell from 14% to 9% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 36% decrease compared with the starting number.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 99

Level 4

A report about medication reminder texts for older patients says missed-dose reports rose from 10% to 15% after a test program. What is the clearest way to describe the change?

A. It rose by 15 percentage points, because the ending rate should be copied as the point change.	**B.** It rose by 5 percentage points, which is about a 50% increase compared with the starting number.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 100

Level 4

A report about a four-day workweek test for software engineers says staff resignations fell from 16% to 11% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 11 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5 percentage points, which is about a 31% decrease compared with the starting number.	**D.** It fell by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 101

Level 4

A report about larger grocery unit-price labels says shopper overpayment complaints rose from 12% to 17% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It rose by 5 percentage points, which is about a 42% increase compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 102

Level 4

A report about late fines on children's books says library card renewals fell from 9% to 4% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 56% decrease compared with the starting number.	**B.** It fell by 4 percentage points, because the ending rate should be copied as the point change.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 103

Level 4

A report about two-factor login for site administrators says admin account takeovers rose from 5% to 10% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It rose by 5 percentage points, which is about a 100% increase compared with the starting number.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It rose by 10 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 104

Level 4

A report about brighter streetlights on Maple Street says reported thefts fell from 11% to 6% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It fell by 6 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5 percentage points, which is about a 45% decrease compared with the starting number.	**D.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 105

Level 4

A report about peer tutoring for first-year statistics students says course pass rates rose from 7% to 12% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It rose by 5 percentage points, which is about a 71% increase compared with the starting number.
C. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It rose by 12 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 106

Level 4

A report about calorie labels on restaurant menus says dessert orders fell from 13% to 8% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It fell by 5 percentage points, which is about a 38% decrease compared with the starting number.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 107

Level 4

A report about bank overdraft warning texts says overdraft fees rose from 9% to 14% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 56% increase compared with the starting number.	**B.** It rose by 14 percentage points, because the ending rate should be copied as the point change.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 108

Level 4

A report about timed-entry passes for weekend park trails says trail crowding complaints fell from 15% to 10% after a test program. What is the clearest way to describe the change?

A. It fell by 10 percentage points, because the ending rate should be copied as the point change.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It fell by 5 percentage points, which is about a 33% decrease compared with the starting number.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 109

Level 4

A report about free Friday museum admission says family visits rose from 11% to 16% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 45% increase compared with the starting number.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 16 percentage points, because the ending rate should be copied as the point change.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 110

Level 4

A report about youth soccer concussion checks says repeat head injuries fell from 17% to 12% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 12 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It fell by 5 percentage points, which is about a 29% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 111

Level 4

A report about same-day donation receipts says donor retention rose from 4% to 9% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 125% increase compared with the starting number.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It rose by 9 percentage points, because the ending rate should be copied as the point change.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 112

Level 4

A report about warehouse ergonomic training says back-injury claims fell from 10% to 5% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It fell by 5 percentage points, which is about a 50% decrease compared with the starting number.	**D.** It fell by 5 percentage points, because the ending rate should be copied as the point change.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 113

Level 4

A report about apartment-lobby compost bins says landfill waste from participating buildings rose from 6% to 11% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 83% increase compared with the starting number.	**B.** It rose by 11 percentage points, because the ending rate should be copied as the point change.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 114

Level 4

A report about private-by-default app profiles says publicly visible profiles fell from 12% to 7% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 7 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5 percentage points, which is about a 42% decrease compared with the starting number.	**D.** It fell by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 115

Level 4

A report about same-day clinic appointment slots says patient no-show rates rose from 8% to 13% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It rose by 13 percentage points, because the ending rate should be copied as the point change.
C. It rose by 5 percentage points, which is about a 63% increase compared with the starting number.	**D.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 116

Level 4

A report about seat-zone airline boarding says average boarding time fell from 14% to 9% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 5 percentage points, which is about a 36% decrease compared with the starting number.
C. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It fell by 9 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 117

Level 4

A report about an online apartment repair portal says unresolved repair requests rose from 10% to 15% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 5 percentage points, which is about a 50% increase compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 118

Level 4

A report about fruit placement in a school cafeteria line says fruit purchases fell from 16% to 11% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 31% decrease compared with the starting number.	**B.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 119

Level 4

A report about weekly call-center script coaching says customer complaint rates rose from 12% to 17% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It rose by 5 percentage points, which is about a 42% increase compared with the starting number.
C. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 120

Level 4

A report about household water-leak alerts says average household water use fell from 9% to 4% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by 4 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5 percentage points, which is about a 56% decrease compared with the starting number.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 121

Level 4

A report about body-camera activation reminders says missing-camera-footage reports rose from 5% to 10% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It rose by 5 percentage points, which is about a 100% increase compared with the starting number.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 10 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 122

Level 4

A report about county mail-ballot tracking says phone calls asking ballot status fell from 11% to 6% after a test program. What is the clearest way to describe the change?

A. It fell by 6 percentage points, because the ending rate should be copied as the point change.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 5 percentage points, which is about a 45% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 123

Level 4

A report about language-learning spaced-review prompts says vocabulary retention quiz scores rose from 7% to 12% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It rose by 5 percentage points, which is about a 71% increase compared with the starting number.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 12 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 124

Level 4

A report about a beginner gym orientation says new-member cancellations fell from 13% to 8% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 8 percentage points, because the ending rate should be copied as the point change.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 5 percentage points, which is about a 38% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 125

Level 4

A report about safe-driving feedback for policyholders says reported minor crashes rose from 9% to 14% after a test program. What is the clearest way to describe the change?

A. It rose by 14 percentage points, because the ending rate should be copied as the point change.	**B.** It rose by 5 percentage points, which is about a 56% increase compared with the starting number.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 126

Level 4

A report about top-of-article correction boxes says reader trust ratings fell from 15% to 10% after a test program. What is the clearest way to describe the change?

A. It fell by 10 percentage points, because the ending rate should be copied as the point change.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It fell by 5 percentage points, which is about a 33% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 127

Level 4

A report about clearer farmers market price signs says price disputes rose from 11% to 16% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 45% increase compared with the starting number.	**B.** It rose by 5%, because a 5-point change and a 5% change are the same thing.
C. It rose by 16 percentage points, because the ending rate should be copied as the point change.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 128

Level 4

A report about hotel quiet-hours text reminders says noise complaints from guest rooms fell from 17% to 12% after a test program. What is the clearest way to describe the change?

A. It fell by 12 percentage points, because the ending rate should be copied as the point change.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It fell by 5 percentage points, which is about a 29% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

A report about evening bus service for late-shift workers says late-shift commute complaints fell from 14% to 9% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 5 percentage points, which is about a 36% decrease compared with the starting number.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 9 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 130

Level 5

A report about classroom phone lockers says classroom disruption reports rose from 10% to 15% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 50% increase compared with the starting number.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 15 percentage points, because the ending rate should be copied as the point change.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 131

Level 5

A report about medication reminder texts for older patients says missed-dose reports fell from 16% to 11% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by 11 percentage points, because the ending rate should be copied as the point change.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It fell by 5 percentage points, which is about a 31% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 132

Level 5

A report about a four-day workweek test for software engineers says staff resignations rose from 12% to 17% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5 percentage points, which is about a 42% increase compared with the starting number.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 133

Level 5

A report about larger grocery unit-price labels says shopper overpayment complaints fell from 9% to 4% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by 5 percentage points, which is about a 56% decrease compared with the starting number.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 4 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 134

Level 5

A report about late fines on children's books says library card renewals rose from 5% to 10% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 100% increase compared with the starting number.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 135

Level 5

A report about two-factor login for site administrators says admin account takeovers fell from 11% to 6% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by 6 percentage points, because the ending rate should be copied as the point change.	**D.** It fell by 5 percentage points, which is about a 45% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 136

Level 5

A report about brighter streetlights on Maple Street says reported thefts rose from 7% to 12% after a test program. What is the clearest way to describe the change?

A. It rose by 12 percentage points, because the ending rate should be copied as the point change.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It rose by 5 percentage points, which is about a 71% increase compared with the starting number.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 137

Level 5

A report about peer tutoring for first-year statistics students says course pass rates fell from 13% to 8% after a test program. What is the clearest way to describe the change?

A. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 5 percentage points, which is about a 38% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 138

Level 5

A report about calorie labels on restaurant menus says dessert orders rose from 9% to 14% after a test program. What is the clearest way to describe the change?

A. It rose by 14 percentage points, because the ending rate should be copied as the point change.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It rose by 5 percentage points, which is about a 56% increase compared with the starting number.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 139

Level 5

A report about bank overdraft warning texts says overdraft fees fell from 15% to 10% after a test program. What is the clearest way to describe the change?

A. It fell by 10 percentage points, because the ending rate should be copied as the point change.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by 5 percentage points, which is about a 33% decrease compared with the starting number.	**D.** It fell by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 140

Level 5

A report about timed-entry passes for weekend park trails says trail crowding complaints rose from 11% to 16% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It rose by 16 percentage points, because the ending rate should be copied as the point change.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 5 percentage points, which is about a 45% increase compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 141

Level 5

A report about free Friday museum admission says family visits fell from 17% to 12% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 29% decrease compared with the starting number.	**B.** It fell by 12 percentage points, because the ending rate should be copied as the point change.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It fell by 5%, because a 5-point change and a 5% change are the same thing.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 142

Level 5

A report about youth soccer concussion checks says repeat head injuries rose from 4% to 9% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It rose by 5 percentage points, which is about a 125% increase compared with the starting number.
C. It rose by 9 percentage points, because the ending rate should be copied as the point change.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 143

Level 5

A report about same-day donation receipts says donor retention fell from 10% to 5% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by 5 percentage points, which is about a 50% decrease compared with the starting number.	**D.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 144

Level 5

A report about warehouse ergonomic training says back-injury claims rose from 6% to 11% after a test program. What is the clearest way to describe the change?

A. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 11 percentage points, because the ending rate should be copied as the point change.	**D.** It rose by 5 percentage points, which is about a 83% increase compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 145

Level 5

A report about apartment-lobby compost bins says landfill waste from participating buildings fell from 12% to 7% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 42% decrease compared with the starting number.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It fell by 5%, because a 5-point change and a 5% change are the same thing.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 146

Level 5

A report about private-by-default app profiles says publicly visible profiles rose from 8% to 13% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It rose by 5 percentage points, which is about a 63% increase compared with the starting number.
C. It rose by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It rose by 13 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 147

Level 5

A report about same-day clinic appointment slots says patient no-show rates fell from 14% to 9% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 36% decrease compared with the starting number.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by 9 percentage points, because the ending rate should be copied as the point change.	**D.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 148

Level 5

A report about seat-zone airline boarding says average boarding time rose from 10% to 15% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It rose by 5 percentage points, which is about a 50% increase compared with the starting number.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 149

Level 5

A report about an online apartment repair portal says unresolved repair requests fell from 16% to 11% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It fell by 5 percentage points, which is about a 31% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 150

Level 5

A report about fruit placement in a school cafeteria line says fruit purchases rose from 12% to 17% after a test program. What is the clearest way to describe the change?

A. It rose by 17 percentage points, because the ending rate should be copied as the point change.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5 percentage points, which is about a 42% increase compared with the starting number.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 151

Level 5

A report about weekly call-center script coaching says customer complaint rates fell from 9% to 4% after a test program. What is the clearest way to describe the change?

A. It fell by 4 percentage points, because the ending rate should be copied as the point change.	**B.** It fell by 5 percentage points, which is about a 56% decrease compared with the starting number.
C. It fell by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 152

Level 5

A report about household water-leak alerts says average household water use rose from 5% to 10% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 100% increase compared with the starting number.	**B.** It rose by 10 percentage points, because the ending rate should be copied as the point change.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 153

Level 5

A report about body-camera activation reminders says missing-camera-footage reports fell from 11% to 6% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It fell by 5 percentage points, which is about a 45% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 154

Level 5

A report about county mail-ballot tracking says phone calls asking ballot status rose from 7% to 12% after a test program. What is the clearest way to describe the change?

A. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5 percentage points, which is about a 71% increase compared with the starting number.	**D.** It rose by 5%, because a 5-point change and a 5% change are the same thing.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percent change compares the movement with the starting value, not only the final value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

Question 155

Level 5

A report about language-learning spaced-review prompts says vocabulary retention quiz scores fell from 13% to 8% after a test program. What is the clearest way to describe the change?

A. It fell by 5 percentage points, which is about a 38% decrease compared with the starting number.	**B.** It fell by 5%, because a 5-point change and a 5% change are the same thing.
C. It fell by 8 percentage points, because the ending rate should be copied as the point change.	**D.** It cannot be described without knowing the total population, even though the starting and ending rates are given.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. The starting and ending rates are enough to describe this change.

Question 156

Level 5

A report about a beginner gym orientation says new-member cancellations rose from 9% to 14% after a test program. What is the clearest way to describe the change?

A. It rose by 14 percentage points, because the ending rate should be copied as the point change.	**B.** It cannot be described without knowing the total population, even though the starting and ending rates are given.
C. It rose by 5 percentage points, which is about a 56% increase compared with the starting number.	**D.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: C. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is C because it reads the quantity in the right context.

A. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

B. Not correct. The starting and ending rates are enough to describe this change.

C. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 157

Level 5

A report about safe-driving feedback for policyholders says reported minor crashes fell from 15% to 10% after a test program. What is the clearest way to describe the change?

A. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**B.** It fell by 5 percentage points, which is about a 33% decrease compared with the starting number.
C. It fell by 10 percentage points, because the ending rate should be copied as the point change.	**D.** It fell by about 5% compared with the ending number, because the final rate is the only number that matters.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

D. Not correct. Percent change compares the movement with the starting value, not only the final value.

Question 158

Level 5

A report about top-of-article correction boxes says reader trust ratings rose from 11% to 16% after a test program. What is the clearest way to describe the change?

A. It rose by 5 percentage points, which is about a 45% increase compared with the starting number.	**B.** It rose by about 5% compared with the ending number, because the final rate is the only number that matters.
C. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**D.** It rose by 16 percentage points, because the ending rate should be copied as the point change.

Answer: A. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is A because it reads the quantity in the right context.

A. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

B. Not correct. Percent change compares the movement with the starting value, not only the final value.

C. Not correct. The starting and ending rates are enough to describe this change.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Question 159

Level 5

A report about clearer farmers market price signs says price disputes fell from 17% to 12% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It fell by 12 percentage points, because the ending rate should be copied as the point change.
C. It fell by 5%, because a 5-point change and a 5% change are the same thing.	**D.** It fell by 5 percentage points, which is about a 29% decrease compared with the starting number.

Answer: D. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is D because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

C. Not correct. Percentage points and percent change are different; the starting value matters for percent change.

D. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

Question 160

Level 5

A report about hotel quiet-hours text reminders says noise complaints from guest rooms rose from 4% to 9% after a test program. What is the clearest way to describe the change?

A. It cannot be described without knowing the total population, even though the starting and ending rates are given.	**B.** It rose by 5 percentage points, which is about a 125% increase compared with the starting number.
C. It rose by about 5% compared with the ending number, because the final rate is the only number that matters.	**D.** It rose by 9 percentage points, because the ending rate should be copied as the point change.

Answer: B. For numbers, pay attention to group size and to the difference between percentage points and percent change.

How to work it out. To uncover the answer, identify the denominator, baseline, rate, or comparison that makes the number meaningful. The correct choice is B because it reads the quantity in the right context.

A. Not correct. The starting and ending rates are enough to describe this change.

B. Correct. This answer reads the numbers with the right comparison. For numbers, pay attention to group size and to the difference between percentage points and percent change.

C. Not correct. Percent change compares the movement with the starting value, not only the final value.

D. Not correct. Percentage points are found by subtracting the starting rate from the ending rate, not by copying the ending value.

Skill 12

Separate Correlation and Causation

Cause or Coincidence?

Explain why a cause claim is not proven yet. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	Has the argument shown that one thing caused another?
Why it matters	Cause claims are powerful because they suggest action. They also require discipline: timing, correlation, or improvement after a plan is not enough by itself.
Conceptual core	Causal claims are attractive because they suggest a lever for action. Students should learn that timing and correlation are clues, not proof. A responsible causal judgment asks about comparison groups, other changes, selection effects, reverse direction, and plausible mechanisms. This skill slows the leap from after this to because of this.
Student method	Look for another change that happened at the same time, a missing comparison group, reverse direction, selection effects, or a reason the result might have changed anyway.
Analogy	Causation is a courtroom claim. A suspect being near the scene matters, but it is not a conviction without ruling out other explanations.
Assessment focus	A good answer explains why the cause is not yet proven or identifies evidence that would better test the causal link.

Teaching Sequence

1. Check whether the alleged cause happened before the effect.

2. Ask what else changed at the same time.

3. Look for a comparison group or baseline trend.

4. Consider whether the effect could have influenced the supposed cause.

Common Confusions To Watch For

1. Students may assume that improvement after a plan proves the plan caused it.

2. Students may treat correlation as useless rather than as a clue that needs testing.

3. Students may ignore selection effects when people choose into a program.

Teacher Prompts

1. What would we need to compare?

2. What else could have changed?

3. Could the cause and effect be reversed or both caused by a third factor?

Worked Example

Scenario	Reported thefts drop after brighter streetlights are installed, but the city also increases evening patrols that month.
Teacher think-aloud	The drop is compatible with the lights helping, but patrols are a rival cause. A better design would compare similar streets with and without the lighting change while tracking patrol changes.
Student takeaway	A causal claim gets stronger when rival causes are ruled out.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. Reported thefts on a street fall from 50 in September to 35 in October. Brighter lights are installed at the start of October, and extra evening patrols begin that same day. The mayor says the lights caused the drop.

What To Do

1. State the observed change separately from the mayor's causal explanation.

2. Name the other change that could explain some or all of the drop.

3. Propose a comparison that would help separate the effects: describe which streets to compare and which other condition should be kept similar. Do not claim your proposed comparison has already been done.

Check before reading the answer. Does the comparison vary lighting without also giving only the newly lit streets extra patrols?

Model Answer

The observation is that reports fell from 50 to 35 after two changes. Extra patrols are a rival explanation. Compare similar streets over the same period, some receiving brighter lights and others retaining existing lights, while keeping patrol levels comparable; random assignment of lighting would make the test stronger where feasible.

Why it is adequate. It identifies the simultaneous change and proposes evidence that could distinguish explanations instead of treating 'after' as 'because of'.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

The city council tried a plan to extend evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.	**B.** The new buses were repainted blue. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 2

Level 1

The school board tried a plan to require phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The lockers are installed near the gym. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 3

Level 1

The hospital tried a plan to send medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The text messages use a green pill icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 4

Level 1

The company tried a plan to test a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The test calendar starts on a Monday. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 5

Level 1

The grocery chain tried a plan to add larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The shelf labels use bold black numbers. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 6

Level 1

The library tried a plan to waive late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The library also opened on Sundays; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The children's-book checkout desk moved six feet. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 7

Level 1

The platform tried a plan to require two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The login button changed from green to blue. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 8

Level 1

The neighborhood association tried a plan to add brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The new light poles are made of aluminum. That visible detail describes the setting but does not identify a competing cause.	**B.** Police patrols increased during the same period; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 9

Level 1

The university tried a plan to expand peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The tutoring room has new chairs. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The final exam was also shortened; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 10

Level 1

The restaurant group tried a plan to show calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The lunch menus are printed on thicker paper. That visible detail describes the setting but does not identify a competing cause.	**D.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 11

Level 1

The bank tried a plan to send overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The warning texts arrive from a short code. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The bank also changed its fee grace period; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 12

Level 1

The park service tried a plan to use timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The digital passes include a small trail map. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 13

Level 1

The museum tried a plan to offer free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The Friday tickets are scanned at the east door. That visible detail describes the setting but does not identify a competing cause.	**B.** A new children's exhibit opened the same week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 14

Level 1

The sports league tried a plan to add mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The league also shortened the season; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The concussion checklist is printed on yellow paper. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 15

Level 1

The nonprofit tried a plan to send donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The receipt email subject line changed. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 16

Level 1

The warehouse tried a plan to offer monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**D.** The training room has a ceiling-mounted projector. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 17

Level 1

The city sanitation office tried a plan to place compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** Trash pickup schedules also changed; that happened during the same period and could also explain the change.
C. The lobby compost bins have foot pedals. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 18

Level 1

The app maker tried a plan to make new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**B.** The privacy screen uses a shield icon. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 19

Level 1

The clinic tried a plan to reserve same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The appointment cards are white. That visible detail describes the setting but does not identify a competing cause.	**D.** The clinic also began reminder calls; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 20

Level 1

The airline tried a plan to board passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**D.** The gate signs are backlit. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 21

Level 1

The landlord tried a plan to launch an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**D.** The repair portal uses a house logo. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 22

Level 1

The cafeteria tried a plan to move fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The fruit bowls are ceramic. That visible detail describes the setting but does not identify a competing cause.	**D.** A fruit discount started that week; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 23

Level 1

The call center tried a plan to give support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The call queue was also shortened; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The coaching slides use blue headers. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 24

Level 1

The water utility tried a plan to send automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** A rainy season began during the study; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The water-leak alert screen includes a blue droplet icon. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 25

Level 1

The police department tried a plan to send body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**D.** The reminder tone is two beeps. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 26

Level 1

The election office tried a plan to offer online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The ballot-tracking page uses county colors. That visible detail describes the setting but does not identify a competing cause.	**D.** The office also expanded its phone staff; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 27

Level 1

The tutoring app tried a plan to send spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The app also changed the quiz format; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The review prompts use a bell icon. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 28

Level 1

The gym tried a plan to offer a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The gym also discounted annual plans; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The orientation mats are black. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 29

Level 1

The insurer tried a plan to send weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**B.** The feedback dashboard uses star ratings. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 30

Level 1

The newsroom tried a plan to place corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The correction box has a gray border. That visible detail describes the setting but does not identify a competing cause.	**B.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 31

Level 1

The farmers market tried a plan to require clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The market also added a weekend help desk; that happened during the same period and could also explain the change.	**B.** The stall price signs are laminated. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 32

Level 1

The hotel tried a plan to send quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The quiet-hours text reminder uses a small moon icon. That visible detail describes the setting but does not identify a competing cause.
C. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

The city council tried a plan to extend evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The new buses were repainted blue. That visible detail describes the setting but does not identify a competing cause.	**B.** A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 34

Level 2

The school board tried a plan to require phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.	**B.** The lockers are installed near the gym. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 35

Level 2

The hospital tried a plan to send medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The text messages use a green pill icon. That visible detail describes the setting but does not identify a competing cause.	**D.** Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 36

Level 2

The company tried a plan to test a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The test calendar starts on a Monday. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The company also raised salaries that quarter; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 37

Level 2

The grocery chain tried a plan to add larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The shelf labels use bold black numbers. That visible detail describes the setting but does not identify a competing cause.	**B.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 38

Level 2

The library tried a plan to waive late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The library also opened on Sundays; that happened during the same period and could also explain the change.	**B.** The children's-book checkout desk moved six feet. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 39

Level 2

The platform tried a plan to require two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The login button changed from green to blue. That visible detail describes the setting but does not identify a competing cause.	**D.** Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 40

Level 2

The neighborhood association tried a plan to add brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The new light poles are made of aluminum. That visible detail describes the setting but does not identify a competing cause.
C. Police patrols increased during the same period; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 41

Level 2

The university tried a plan to expand peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The final exam was also shortened; that happened during the same period and could also explain the change.
C. The tutoring room has new chairs. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 42

Level 2

The restaurant group tried a plan to show calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. Dessert prices increased at the same time; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The lunch menus are printed on thicker paper. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 43

Level 2

The bank tried a plan to send overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The bank also changed its fee grace period; that happened during the same period and could also explain the change.	**D.** The warning texts arrive from a short code. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 44

Level 2

The park service tried a plan to use timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The digital passes include a small trail map. That visible detail describes the setting but does not identify a competing cause.	**D.** A nearby trail reopened that month; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 45

Level 2

The museum tried a plan to offer free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. A new children's exhibit opened the same week; that happened during the same period and could also explain the change.	**B.** The Friday tickets are scanned at the east door. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 46

Level 2

The sports league tried a plan to add mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The league also shortened the season; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The concussion checklist is printed on yellow paper. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 47

Level 2

The nonprofit tried a plan to send donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The receipt email subject line changed. That visible detail describes the setting but does not identify a competing cause.
C. The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 48

Level 2

The warehouse tried a plan to offer monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The training room has a ceiling-mounted projector. That visible detail describes the setting but does not identify a competing cause.	**D.** New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 49

Level 2

The city sanitation office tried a plan to place compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. Trash pickup schedules also changed; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The lobby compost bins have foot pedals. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 50

Level 2

The app maker tried a plan to make new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The app also deleted inactive accounts; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The privacy screen uses a shield icon. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 51

Level 2

The clinic tried a plan to reserve same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The clinic also began reminder calls; that happened during the same period and could also explain the change.	**D.** The appointment cards are white. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 52

Level 2

The airline tried a plan to board passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The gate signs are backlit. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 53

Level 2

The landlord tried a plan to launch an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The repair portal uses a house logo. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 54

Level 2

The cafeteria tried a plan to move fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. A fruit discount started that week; that happened during the same period and could also explain the change.	**D.** The fruit bowls are ceramic. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 55

Level 2

The call center tried a plan to give support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The coaching slides use blue headers. That visible detail describes the setting but does not identify a competing cause.	**B.** The call queue was also shortened; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 56

Level 2

The water utility tried a plan to send automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. A rainy season began during the study; that happened during the same period and could also explain the change.	**B.** The water-leak alert screen includes a blue droplet icon. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 57

Level 2

The police department tried a plan to send body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The reminder tone is two beeps. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The department also updated supervisor reviews; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 58

Level 2

The election office tried a plan to offer online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The ballot-tracking page uses county colors. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The office also expanded its phone staff; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 59

Level 2

The tutoring app tried a plan to send spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The app also changed the quiz format; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The review prompts use a bell icon. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 60

Level 2

The gym tried a plan to offer a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The gym also discounted annual plans; that happened during the same period and could also explain the change.	**D.** The orientation mats are black. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 61

Level 2

The insurer tried a plan to send weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The feedback dashboard uses star ratings. That visible detail describes the setting but does not identify a competing cause.	**B.** Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 62

Level 2

The newsroom tried a plan to place corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The newsroom also hired a public editor; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The correction box has a gray border. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 63

Level 2

The farmers market tried a plan to require clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The stall price signs are laminated. That visible detail describes the setting but does not identify a competing cause.	**D.** The market also added a weekend help desk; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 64

Level 2

The hotel tried a plan to send quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The hotel also changed room assignments; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The quiet-hours text reminder uses a small moon icon. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

The city council tried a plan to extend evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.	**B.** The new buses were repainted blue. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 66

Level 3

The school board tried a plan to require phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The lockers are installed near the gym. That visible detail describes the setting but does not identify a competing cause.	**B.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 67

Level 3

The hospital tried a plan to send medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The text messages use a green pill icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 68

Level 3

The company tried a plan to test a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The test calendar starts on a Monday. That visible detail describes the setting but does not identify a competing cause.	**D.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 69

Level 3

The grocery chain tried a plan to add larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The shelf labels use bold black numbers. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 70

Level 3

The library tried a plan to waive late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The library also opened on Sundays; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The children's-book checkout desk moved six feet. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 71

Level 3

The platform tried a plan to require two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The login button changed from green to blue. That visible detail describes the setting but does not identify a competing cause.
C. Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 72

Level 3

The neighborhood association tried a plan to add brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The new light poles are made of aluminum. That visible detail describes the setting but does not identify a competing cause.	**D.** Police patrols increased during the same period; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 73

Level 3

The university tried a plan to expand peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The final exam was also shortened; that happened during the same period and could also explain the change.	**B.** The tutoring room has new chairs. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 74

Level 3

The restaurant group tried a plan to show calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The lunch menus are printed on thicker paper. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 75

Level 3

The bank tried a plan to send overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The warning texts arrive from a short code. That visible detail describes the setting but does not identify a competing cause.	**D.** The bank also changed its fee grace period; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 76

Level 3

The park service tried a plan to use timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The digital passes include a small trail map. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 77

Level 3

The museum tried a plan to offer free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** A new children's exhibit opened the same week; that happened during the same period and could also explain the change.
C. The Friday tickets are scanned at the east door. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 78

Level 3

The sports league tried a plan to add mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The league also shortened the season; that happened during the same period and could also explain the change.	**B.** The concussion checklist is printed on yellow paper. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 79

Level 3

The nonprofit tried a plan to send donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The receipt email subject line changed. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 80

Level 3

The warehouse tried a plan to offer monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The training room has a ceiling-mounted projector. That visible detail describes the setting but does not identify a competing cause.	**B.** New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 81

Level 3

The city sanitation office tried a plan to place compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The lobby compost bins have foot pedals. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** Trash pickup schedules also changed; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 82

Level 3

The app maker tried a plan to make new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The app also deleted inactive accounts; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The privacy screen uses a shield icon. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 83

Level 3

The clinic tried a plan to reserve same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The clinic also began reminder calls; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The appointment cards are white. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 84

Level 3

The airline tried a plan to board passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The gate signs are backlit. That visible detail describes the setting but does not identify a competing cause.	**D.** The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 85

Level 3

The landlord tried a plan to launch an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**D.** The repair portal uses a house logo. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 86

Level 3

The cafeteria tried a plan to move fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. A fruit discount started that week; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The fruit bowls are ceramic. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 87

Level 3

The call center tried a plan to give support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The call queue was also shortened; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The coaching slides use blue headers. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 88

Level 3

The water utility tried a plan to send automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The water-leak alert screen includes a blue droplet icon. That visible detail describes the setting but does not identify a competing cause.	**B.** A rainy season began during the study; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 89

Level 3

The police department tried a plan to send body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**B.** The reminder tone is two beeps. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 90

Level 3

The election office tried a plan to offer online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The ballot-tracking page uses county colors. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The office also expanded its phone staff; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 91

Level 3

The tutoring app tried a plan to send spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The app also changed the quiz format; that happened during the same period and could also explain the change.	**B.** The review prompts use a bell icon. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 92

Level 3

The gym tried a plan to offer a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The orientation mats are black. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The gym also discounted annual plans; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 93

Level 3

The insurer tried a plan to send weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The feedback dashboard uses star ratings. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 94

Level 3

The newsroom tried a plan to place corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The correction box has a gray border. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 95

Level 3

The farmers market tried a plan to require clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The stall price signs are laminated. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The market also added a weekend help desk; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 96

Level 3

The hotel tried a plan to send quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The quiet-hours text reminder uses a small moon icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

The city council tried a plan to extend evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The new buses were repainted blue. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 98

Level 4

The school board tried a plan to require phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.
C. The lockers are installed near the gym. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 99

Level 4

The hospital tried a plan to send medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The text messages use a green pill icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 100

Level 4

The company tried a plan to test a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.
C. The test calendar starts on a Monday. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 101

Level 4

The grocery chain tried a plan to add larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The shelf labels use bold black numbers. That visible detail describes the setting but does not identify a competing cause.	**D.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 102

Level 4

The library tried a plan to waive late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The children's-book checkout desk moved six feet. That visible detail describes the setting but does not identify a competing cause.	**B.** The library also opened on Sundays; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 103

Level 4

The platform tried a plan to require two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The login button changed from green to blue. That visible detail describes the setting but does not identify a competing cause.	**D.** Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 104

Level 4

The neighborhood association tried a plan to add brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** Police patrols increased during the same period; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The new light poles are made of aluminum. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 105

Level 4

The university tried a plan to expand peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The tutoring room has new chairs. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The final exam was also shortened; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 106

Level 4

The restaurant group tried a plan to show calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The lunch menus are printed on thicker paper. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 107

Level 4

The bank tried a plan to send overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The warning texts arrive from a short code. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The bank also changed its fee grace period; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 108

Level 4

The park service tried a plan to use timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**B.** The digital passes include a small trail map. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 109

Level 4

The museum tried a plan to offer free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The Friday tickets are scanned at the east door. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. A new children's exhibit opened the same week; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 110

Level 4

The sports league tried a plan to add mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The league also shortened the season; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The concussion checklist is printed on yellow paper. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 111

Level 4

The nonprofit tried a plan to send donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The receipt email subject line changed. That visible detail describes the setting but does not identify a competing cause.
C. The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 112

Level 4

The warehouse tried a plan to offer monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The training room has a ceiling-mounted projector. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 113

Level 4

The city sanitation office tried a plan to place compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. Trash pickup schedules also changed; that happened during the same period and could also explain the change.	**D.** The lobby compost bins have foot pedals. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 114

Level 4

The app maker tried a plan to make new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The privacy screen uses a shield icon. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 115

Level 4

The clinic tried a plan to reserve same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The appointment cards are white. That visible detail describes the setting but does not identify a competing cause.
C. The clinic also began reminder calls; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 116

Level 4

The airline tried a plan to board passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The gate signs are backlit. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 117

Level 4

The landlord tried a plan to launch an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**D.** The repair portal uses a house logo. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 118

Level 4

The cafeteria tried a plan to move fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The fruit bowls are ceramic. That visible detail describes the setting but does not identify a competing cause.	**B.** A fruit discount started that week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 119

Level 4

The call center tried a plan to give support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The call queue was also shortened; that happened during the same period and could also explain the change.	**B.** The coaching slides use blue headers. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 120

Level 4

The water utility tried a plan to send automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The water-leak alert screen includes a blue droplet icon. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** A rainy season began during the study; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 121

Level 4

The police department tried a plan to send body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The reminder tone is two beeps. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 122

Level 4

The election office tried a plan to offer online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The ballot-tracking page uses county colors. That visible detail describes the setting but does not identify a competing cause.	**B.** The office also expanded its phone staff; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 123

Level 4

The tutoring app tried a plan to send spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The app also changed the quiz format; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The review prompts use a bell icon. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 124

Level 4

The gym tried a plan to offer a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The orientation mats are black. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The gym also discounted annual plans; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 125

Level 4

The insurer tried a plan to send weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**D.** The feedback dashboard uses star ratings. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 126

Level 4

The newsroom tried a plan to place corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The correction box has a gray border. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 127

Level 4

The farmers market tried a plan to require clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The stall price signs are laminated. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The market also added a weekend help desk; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 128

Level 4

The hotel tried a plan to send quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The quiet-hours text reminder uses a small moon icon. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

The city council tried a plan to extend evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.	**B.** The new buses were repainted blue. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 130

Level 5

The school board tried a plan to require phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The lockers are installed near the gym. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 131

Level 5

The hospital tried a plan to send medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.	**D.** The text messages use a green pill icon. That visible detail describes the setting but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 132

Level 5

The company tried a plan to test a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The test calendar starts on a Monday. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 133

Level 5

The grocery chain tried a plan to add larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.	**B.** The shelf labels use bold black numbers. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 134

Level 5

The library tried a plan to waive late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The library also opened on Sundays; that happened during the same period and could also explain the change.
C. The children's-book checkout desk moved six feet. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 135

Level 5

The platform tried a plan to require two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The login button changed from green to blue. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 136

Level 5

The neighborhood association tried a plan to add brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The new light poles are made of aluminum. That visible detail describes the setting but does not identify a competing cause.	**D.** Police patrols increased during the same period; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 137

Level 5

The university tried a plan to expand peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The final exam was also shortened; that happened during the same period and could also explain the change.	**B.** The tutoring room has new chairs. That visible detail describes the setting but does not identify a competing cause.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 138

Level 5

The restaurant group tried a plan to show calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.
C. The lunch menus are printed on thicker paper. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 139

Level 5

The bank tried a plan to send overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The bank also changed its fee grace period; that happened during the same period and could also explain the change.
C. The warning texts arrive from a short code. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 140

Level 5

The park service tried a plan to use timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The digital passes include a small trail map. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 141

Level 5

The museum tried a plan to offer free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The Friday tickets are scanned at the east door. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** A new children's exhibit opened the same week; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 142

Level 5

The sports league tried a plan to add mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The concussion checklist is printed on yellow paper. That visible detail describes the setting but does not identify a competing cause.
C. The league also shortened the season; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 143

Level 5

The nonprofit tried a plan to send donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.
C. The receipt email subject line changed. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 144

Level 5

The warehouse tried a plan to offer monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The training room has a ceiling-mounted projector. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 145

Level 5

The city sanitation office tried a plan to place compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The lobby compost bins have foot pedals. That visible detail describes the setting but does not identify a competing cause.	**D.** Trash pickup schedules also changed; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 146

Level 5

The app maker tried a plan to make new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The privacy screen uses a shield icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 147

Level 5

The clinic tried a plan to reserve same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The appointment cards are white. That visible detail describes the setting but does not identify a competing cause.	**B.** The clinic also began reminder calls; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 148

Level 5

The airline tried a plan to board passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The gate signs are backlit. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 149

Level 5

The landlord tried a plan to launch an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The repair portal uses a house logo. That visible detail describes the setting but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 150

Level 5

The cafeteria tried a plan to move fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** A fruit discount started that week; that happened during the same period and could also explain the change.
C. The fruit bowls are ceramic. That visible detail describes the setting but does not identify a competing cause.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 151

Level 5

The call center tried a plan to give support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The coaching slides use blue headers. That visible detail describes the setting but does not identify a competing cause.
C. The call queue was also shortened; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 152

Level 5

The water utility tried a plan to send automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The water-leak alert screen includes a blue droplet icon. That visible detail describes the setting but does not identify a competing cause.	**D.** A rainy season began during the study; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 153

Level 5

The police department tried a plan to send body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which fact would show why Taylor's claim is not proved yet?

A. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The reminder tone is two beeps. That visible detail describes the setting but does not identify a competing cause.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: A. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is A because it blocks the leap from observed change to proven cause.

A. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 154

Level 5

The election office tried a plan to offer online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which fact would show why Morgan's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The office also expanded its phone staff; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The ballot-tracking page uses county colors. That visible detail describes the setting but does not identify a competing cause.

Answer: B. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is B because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

Question 155

Level 5

The tutoring app tried a plan to send spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which fact would show why Casey's claim is not proved yet?

A. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**B.** The review prompts use a bell icon. That visible detail describes the setting but does not identify a competing cause.
C. The app also changed the quiz format; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes the change but does not identify a competing cause.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

Question 156

Level 5

The gym tried a plan to offer a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which fact would show why Jordan's claim is not proved yet?

A. The orientation mats are black. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The gym also discounted annual plans; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 157

Level 5

The insurer tried a plan to send weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which fact would show why Riley's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The feedback dashboard uses star ratings. That visible detail describes the setting but does not identify a competing cause.
C. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Question 158

Level 5

The newsroom tried a plan to place corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which fact would show why Maya's claim is not proved yet?

A. The correction box has a gray border. That visible detail describes the setting but does not identify a competing cause.	**B.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.
C. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**D.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

C. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 159

Level 5

The farmers market tried a plan to require clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which fact would show why Sam's claim is not proved yet?

A. The result is reported as a percentage, which describes the change but does not identify a competing cause.	**B.** The stall price signs are laminated. That visible detail describes the setting but does not identify a competing cause.
C. The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.	**D.** The market also added a weekend help desk; that happened during the same period and could also explain the change.

Answer: D. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is D because it blocks the leap from observed change to proven cause.

A. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

B. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

C. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

D. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

Question 160

Level 5

The hotel tried a plan to send quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which fact would show why Avery's claim is not proved yet?

A. The quiet-hours text reminder uses a small moon icon. That visible detail describes the setting but does not identify a competing cause.	**B.** The result is reported as a percentage, which describes the change but does not identify a competing cause.
C. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**D.** The plan began before the result changed, which shows timing but does not rule out other causes during that period or separate the plan from them.

Answer: C. To prove cause, you need to rule out other likely causes or compare similar groups.

How to work it out. To uncover the answer, ask what else changed or what comparison is missing. The correct choice is C because it blocks the leap from observed change to proven cause.

A. Not correct. A visible detail may describe the situation, but it does not rule out other causes.

B. Not correct. A percentage can describe a change, but it does not by itself show what caused the change.

C. Correct. This fact gives a live alternative cause, so the observed change cannot yet be credited to the plan alone.

D. Not correct. Timing can be relevant, but timing alone does not prove the plan caused the result.

Skill 13

Consider Alternative Explanations

What Else Could Explain It?

Pick another explanation that also fits the facts. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	What else could explain the same facts?
Why it matters	Good thinkers do not stop at the first explanation that fits. They ask what else could make the same facts true, especially when a conclusion is attractive.
Conceptual core	Alternative explanation thinking is disciplined imagination. Students keep the observed evidence fixed and ask what other story could make it true. This reduces premature closure, especially when the first explanation is emotionally satisfying or easy to remember. The strongest alternative explanation is specific, plausible, and compatible with the given facts.
Student method	Keep the observed facts fixed, then generate another story that could produce them. The best alternative is specific and fits the evidence without contradicting it.
Analogy	Alternative explanations are spare keys. If more than one key opens the same lock, you should not assume you have found the only one.
Assessment focus	A good answer names a plausible alternative that matches the observed facts and avoids unsupported contradictions.

Teaching Sequence

1. Name the observed result without interpreting it.

2. Generate another cause, condition, or selection effect that could produce the same result.

3. Reject alternatives that contradict the prompt.

4. Prefer alternatives that are specific enough to test.

Common Confusions To Watch For

1. Students may offer a random possibility that does not fit the facts.

2. Students may think an alternative explanation must disprove the original explanation.

3. Students may choose a vague phrase like many factors without naming one.

Teacher Prompts

1. What fact are we trying to explain?

2. What other story could make that fact true?

3. How could we test the original explanation against this alternative?

Worked Example

Scenario	A museum's family attendance rises after free Friday admission begins, but a popular dinosaur exhibit opens the same weekend.
Teacher think-aloud	Free admission could matter, but the new exhibit could also explain the attendance increase. Both fit the observed rise, so we need more evidence to separate them.
Student takeaway	An alternative explanation does not have to be proven; it has to plausibly fit the same evidence.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A museum's family visits rise from 200 to 320 during the first weekend of free admission. That weekend also brings a new dinosaur exhibit, a school holiday, and unusually heavy rain. The museum credits free admission alone.

What To Do

1. List three rival explanations using the supplied details.

2. For each, write one sentence explaining how it could increase museum visits. Mark these as possibilities, not established causes.

3. Choose one rival and name a comparison that would help distinguish it from the effect of price.

Check before reading the answer. Have you explained a plausible connection for each rival instead of merely listing coinciding events?

Model Answer

The dinosaur exhibit might attract interested families; the holiday might give them more free time; rain might make indoor activities more attractive. To examine the exhibit explanation, compare similar weekends with the same exhibit but different admission prices while keeping holiday and weather conditions as comparable as possible. The supplied facts do not tell us which cause contributed how much.

Why it is adequate. It supplies mechanisms for three alternatives and a relevant follow-up comparison without presenting possibilities as findings.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

The city council tried extending evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The new buses were repainted blue. That visible detail is part of the scene, not another explanation of the change.	**B.** A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 2

Level 1

The school board tried requiring phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The lockers are installed near the gym. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 3

Level 1

The hospital tried sending medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The text messages use a green pill icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 4

Level 1

The company tried testing a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The test calendar starts on a Monday. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The company also raised salaries that quarter; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 5

Level 1

The grocery chain tried adding larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.
C. The shelf labels use bold black numbers. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 6

Level 1

The library tried waiving late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The library also opened on Sundays; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The children's-book checkout desk moved six feet. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 7

Level 1

The platform tried requiring two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The login button changed from green to blue. That visible detail is part of the scene, not another explanation of the change.	**D.** Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 8

Level 1

The neighborhood association tried adding brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. Police patrols increased during the same period; that happened during the same period and could also explain the change.	**D.** The new light poles are made of aluminum. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 9

Level 1

The university tried expanding peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The final exam was also shortened; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The tutoring room has new chairs. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 10

Level 1

The restaurant group tried showing calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. Dessert prices increased at the same time; that happened during the same period and could also explain the change.	**B.** The lunch menus are printed on thicker paper. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 11

Level 1

The bank tried sending overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The warning texts arrive from a short code. That visible detail is part of the scene, not another explanation of the change.
C. The bank also changed its fee grace period; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 12

Level 1

The park service tried using timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The digital passes include a small trail map. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** A nearby trail reopened that month; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 13

Level 1

The museum tried offering free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. A new children's exhibit opened the same week; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The Friday tickets are scanned at the east door. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 14

Level 1

The sports league tried adding mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The league also shortened the season; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The concussion checklist is printed on yellow paper. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 15

Level 1

The nonprofit tried sending donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The receipt email subject line changed. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 16

Level 1

The warehouse tried offering monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The training room has a ceiling-mounted projector. That visible detail is part of the scene, not another explanation of the change.
C. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 17

Level 1

The city sanitation office tried placing compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. Trash pickup schedules also changed; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The lobby compost bins have foot pedals. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 18

Level 1

The app maker tried making new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The privacy screen uses a shield icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 19

Level 1

The clinic tried reserving same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The clinic also began reminder calls; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The appointment cards are white. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 20

Level 1

The airline tried boarding passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The gate signs are backlit. That visible detail is part of the scene, not another explanation of the change.
C. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 21

Level 1

The landlord tried launching an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The repair portal uses a house logo. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 22

Level 1

The cafeteria tried moving fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A fruit discount started that week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The fruit bowls are ceramic. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 23

Level 1

The call center tried giving support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The coaching slides use blue headers. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The call queue was also shortened; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 24

Level 1

The water utility tried sending automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. A rainy season began during the study; that happened during the same period and could also explain the change.	**D.** The water-leak alert screen includes a blue droplet icon. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 25

Level 1

The police department tried sending body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The reminder tone is two beeps. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The department also updated supervisor reviews; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 26

Level 1

The election office tried offering online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The office also expanded its phone staff; that happened during the same period and could also explain the change.
C. The ballot-tracking page uses county colors. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 27

Level 1

The tutoring app tried sending spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The review prompts use a bell icon. That visible detail is part of the scene, not another explanation of the change.	**D.** The app also changed the quiz format; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 28

Level 1

The gym tried offering a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The orientation mats are black. That visible detail is part of the scene, not another explanation of the change.	**B.** The gym also discounted annual plans; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 29

Level 1

The insurer tried sending weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The feedback dashboard uses star ratings. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 30

Level 1

The newsroom tried placing corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The correction box has a gray border. That visible detail is part of the scene, not another explanation of the change.
C. The newsroom also hired a public editor; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 31

Level 1

The farmers market tried requiring clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The market also added a weekend help desk; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The stall price signs are laminated. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 32

Level 1

The hotel tried sending quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The hotel also changed room assignments; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The quiet-hours text reminder uses a small moon icon. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

The city council tried extending evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.	**B.** The new buses were repainted blue. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 34

Level 2

The school board tried requiring phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The lockers are installed near the gym. That visible detail is part of the scene, not another explanation of the change.	**B.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 35

Level 2

The hospital tried sending medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.	**D.** The text messages use a green pill icon. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 36

Level 2

The company tried testing a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The test calendar starts on a Monday. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 37

Level 2

The grocery chain tried adding larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The shelf labels use bold black numbers. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 38

Level 2

The library tried waiving late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The library also opened on Sundays; that happened during the same period and could also explain the change.
C. The children's-book checkout desk moved six feet. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 39

Level 2

The platform tried requiring two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The login button changed from green to blue. That visible detail is part of the scene, not another explanation of the change.
C. Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 40

Level 2

The neighborhood association tried adding brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The new light poles are made of aluminum. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** Police patrols increased during the same period; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 41

Level 2

The university tried expanding peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The tutoring room has new chairs. That visible detail is part of the scene, not another explanation of the change.
C. The final exam was also shortened; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 42

Level 2

The restaurant group tried showing calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The lunch menus are printed on thicker paper. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 43

Level 2

The bank tried sending overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The bank also changed its fee grace period; that happened during the same period and could also explain the change.
C. The warning texts arrive from a short code. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 44

Level 2

The park service tried using timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**B.** The digital passes include a small trail map. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 45

Level 2

The museum tried offering free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The Friday tickets are scanned at the east door. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** A new children's exhibit opened the same week; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 46

Level 2

The sports league tried adding mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The concussion checklist is printed on yellow paper. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The league also shortened the season; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 47

Level 2

The nonprofit tried sending donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The receipt email subject line changed. That visible detail is part of the scene, not another explanation of the change.	**B.** The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 48

Level 2

The warehouse tried offering monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The training room has a ceiling-mounted projector. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 49

Level 2

The city sanitation office tried placing compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The lobby compost bins have foot pedals. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** Trash pickup schedules also changed; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 50

Level 2

The app maker tried making new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**D.** The privacy screen uses a shield icon. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 51

Level 2

The clinic tried reserving same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The appointment cards are white. That visible detail is part of the scene, not another explanation of the change.	**D.** The clinic also began reminder calls; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 52

Level 2

The airline tried boarding passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The gate signs are backlit. That visible detail is part of the scene, not another explanation of the change.
C. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 53

Level 2

The landlord tried launching an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The repair portal uses a house logo. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 54

Level 2

The cafeteria tried moving fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A fruit discount started that week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The fruit bowls are ceramic. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 55

Level 2

The call center tried giving support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The coaching slides use blue headers. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The call queue was also shortened; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 56

Level 2

The water utility tried sending automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The water-leak alert screen includes a blue droplet icon. That visible detail is part of the scene, not another explanation of the change.	**D.** A rainy season began during the study; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 57

Level 2

The police department tried sending body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**B.** The reminder tone is two beeps. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 58

Level 2

The election office tried offering online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The office also expanded its phone staff; that happened during the same period and could also explain the change.
C. The ballot-tracking page uses county colors. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 59

Level 2

The tutoring app tried sending spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The app also changed the quiz format; that happened during the same period and could also explain the change.	**D.** The review prompts use a bell icon. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 60

Level 2

The gym tried offering a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The orientation mats are black. That visible detail is part of the scene, not another explanation of the change.	**D.** The gym also discounted annual plans; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 61

Level 2

The insurer tried sending weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**B.** The feedback dashboard uses star ratings. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 62

Level 2

The newsroom tried placing corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The correction box has a gray border. That visible detail is part of the scene, not another explanation of the change.	**B.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 63

Level 2

The farmers market tried requiring clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The stall price signs are laminated. That visible detail is part of the scene, not another explanation of the change.	**B.** The market also added a weekend help desk; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 64

Level 2

The hotel tried sending quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The quiet-hours text reminder uses a small moon icon. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

The city council tried extending evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The new buses were repainted blue. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 66

Level 3

The school board tried requiring phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The lockers are installed near the gym. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 67

Level 3

The hospital tried sending medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The text messages use a green pill icon. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 68

Level 3

The company tried testing a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The company also raised salaries that quarter; that happened during the same period and could also explain the change.	**D.** The test calendar starts on a Monday. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 69

Level 3

The grocery chain tried adding larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The shelf labels use bold black numbers. That visible detail is part of the scene, not another explanation of the change.	**B.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 70

Level 3

The library tried waiving late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The library also opened on Sundays; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The children's-book checkout desk moved six feet. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 71

Level 3

The platform tried requiring two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The login button changed from green to blue. That visible detail is part of the scene, not another explanation of the change.	**D.** Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 72

Level 3

The neighborhood association tried adding brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. Police patrols increased during the same period; that happened during the same period and could also explain the change.	**D.** The new light poles are made of aluminum. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 73

Level 3

The university tried expanding peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The final exam was also shortened; that happened during the same period and could also explain the change.
C. The tutoring room has new chairs. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 74

Level 3

The restaurant group tried showing calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. Dessert prices increased at the same time; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The lunch menus are printed on thicker paper. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 75

Level 3

The bank tried sending overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The warning texts arrive from a short code. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The bank also changed its fee grace period; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 76

Level 3

The park service tried using timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The digital passes include a small trail map. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** A nearby trail reopened that month; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 77

Level 3

The museum tried offering free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. A new children's exhibit opened the same week; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The Friday tickets are scanned at the east door. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 78

Level 3

The sports league tried adding mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The league also shortened the season; that happened during the same period and could also explain the change.
C. The concussion checklist is printed on yellow paper. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 79

Level 3

The nonprofit tried sending donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The receipt email subject line changed. That visible detail is part of the scene, not another explanation of the change.
C. The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 80

Level 3

The warehouse tried offering monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The training room has a ceiling-mounted projector. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 81

Level 3

The city sanitation office tried placing compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. Trash pickup schedules also changed; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The lobby compost bins have foot pedals. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 82

Level 3

The app maker tried making new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The app also deleted inactive accounts; that happened during the same period and could also explain the change.
C. The privacy screen uses a shield icon. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 83

Level 3

The clinic tried reserving same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The appointment cards are white. That visible detail is part of the scene, not another explanation of the change.
C. The clinic also began reminder calls; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 84

Level 3

The airline tried boarding passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The gate signs are backlit. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 85

Level 3

The landlord tried launching an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The repair portal uses a house logo. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 86

Level 3

The cafeteria tried moving fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The fruit bowls are ceramic. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. A fruit discount started that week; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 87

Level 3

The call center tried giving support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The call queue was also shortened; that happened during the same period and could also explain the change.
C. The coaching slides use blue headers. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 88

Level 3

The water utility tried sending automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. A rainy season began during the study; that happened during the same period and could also explain the change.	**B.** The water-leak alert screen includes a blue droplet icon. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 89

Level 3

The police department tried sending body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The reminder tone is two beeps. That visible detail is part of the scene, not another explanation of the change.	**D.** The department also updated supervisor reviews; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 90

Level 3

The election office tried offering online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The ballot-tracking page uses county colors. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The office also expanded its phone staff; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 91

Level 3

The tutoring app tried sending spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The review prompts use a bell icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The app also changed the quiz format; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 92

Level 3

The gym tried offering a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The gym also discounted annual plans; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The orientation mats are black. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 93

Level 3

The insurer tried sending weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The feedback dashboard uses star ratings. That visible detail is part of the scene, not another explanation of the change.	**D.** Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 94

Level 3

The newsroom tried placing corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The newsroom also hired a public editor; that happened during the same period and could also explain the change.	**D.** The correction box has a gray border. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 95

Level 3

The farmers market tried requiring clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The market also added a weekend help desk; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The stall price signs are laminated. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 96

Level 3

The hotel tried sending quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The quiet-hours text reminder uses a small moon icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The hotel also changed room assignments; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

The city council tried extending evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.	**D.** The new buses were repainted blue. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 98

Level 4

The school board tried requiring phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The lockers are installed near the gym. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 99

Level 4

The hospital tried sending medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.	**B.** The text messages use a green pill icon. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 100

Level 4

The company tried testing a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The test calendar starts on a Monday. That visible detail is part of the scene, not another explanation of the change.	**B.** The company also raised salaries that quarter; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 101

Level 4

The grocery chain tried adding larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The shelf labels use bold black numbers. That visible detail is part of the scene, not another explanation of the change.
C. A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 102

Level 4

The library tried waiving late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The children's-book checkout desk moved six feet. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The library also opened on Sundays; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 103

Level 4

The platform tried requiring two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.	**B.** The login button changed from green to blue. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 104

Level 4

The neighborhood association tried adding brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The new light poles are made of aluminum. That visible detail is part of the scene, not another explanation of the change.	**B.** Police patrols increased during the same period; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 105

Level 4

The university tried expanding peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The final exam was also shortened; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The tutoring room has new chairs. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 106

Level 4

The restaurant group tried showing calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** Dessert prices increased at the same time; that happened during the same period and could also explain the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The lunch menus are printed on thicker paper. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 107

Level 4

The bank tried sending overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The warning texts arrive from a short code. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The bank also changed its fee grace period; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 108

Level 4

The park service tried using timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. A nearby trail reopened that month; that happened during the same period and could also explain the change.	**D.** The digital passes include a small trail map. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 109

Level 4

The museum tried offering free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A new children's exhibit opened the same week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The Friday tickets are scanned at the east door. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 110

Level 4

The sports league tried adding mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The league also shortened the season; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The concussion checklist is printed on yellow paper. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 111

Level 4

The nonprofit tried sending donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The receipt email subject line changed. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 112

Level 4

The warehouse tried offering monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The training room has a ceiling-mounted projector. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 113

Level 4

The city sanitation office tried placing compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** Trash pickup schedules also changed; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The lobby compost bins have foot pedals. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 114

Level 4

The app maker tried making new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The app also deleted inactive accounts; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The privacy screen uses a shield icon. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 115

Level 4

The clinic tried reserving same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The appointment cards are white. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The clinic also began reminder calls; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 116

Level 4

The airline tried boarding passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.	**D.** The gate signs are backlit. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 117

Level 4

The landlord tried launching an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The repair portal uses a house logo. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 118

Level 4

The cafeteria tried moving fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A fruit discount started that week; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The fruit bowls are ceramic. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 119

Level 4

The call center tried giving support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The coaching slides use blue headers. That visible detail is part of the scene, not another explanation of the change.
C. The call queue was also shortened; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 120

Level 4

The water utility tried sending automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The water-leak alert screen includes a blue droplet icon. That visible detail is part of the scene, not another explanation of the change.	**D.** A rainy season began during the study; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 121

Level 4

The police department tried sending body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The department also updated supervisor reviews; that happened during the same period and could also explain the change.	**B.** The reminder tone is two beeps. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 122

Level 4

The election office tried offering online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The ballot-tracking page uses county colors. That visible detail is part of the scene, not another explanation of the change.	**B.** The office also expanded its phone staff; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 123

Level 4

The tutoring app tried sending spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The app also changed the quiz format; that happened during the same period and could also explain the change.	**D.** The review prompts use a bell icon. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 124

Level 4

The gym tried offering a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The orientation mats are black. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The gym also discounted annual plans; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 125

Level 4

The insurer tried sending weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The feedback dashboard uses star ratings. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 126

Level 4

The newsroom tried placing corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The newsroom also hired a public editor; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The correction box has a gray border. That visible detail is part of the scene, not another explanation of the change.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 127

Level 4

The farmers market tried requiring clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The stall price signs are laminated. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The market also added a weekend help desk; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 128

Level 4

The hotel tried sending quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The quiet-hours text reminder uses a small moon icon. That visible detail is part of the scene, not another explanation of the change.
C. The hotel also changed room assignments; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

The city council tried extending evening bus service until midnight. Late-shift commute complaints fell by 22% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** A large employer started a private shuttle the same month; that happened during the same period and could also explain the change.
C. The new buses were repainted blue. That visible detail is part of the scene, not another explanation of the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 130

Level 5

The school board tried requiring phone lockers during class. Classroom disruption reports fell by 31% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. A new hall monitor schedule began at the same time; that happened during the same period and could also explain the change.	**B.** The lockers are installed near the gym. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 131

Level 5

The hospital tried sending medication reminder texts before evening doses. Missed-dose reports fell by 18% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The text messages use a green pill icon. That visible detail is part of the scene, not another explanation of the change.	**D.** Pharmacists also began follow-up calls; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 132

Level 5

The company tried testing a Monday-through-Thursday workweek. Staff resignations fell by 15% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The company also raised salaries that quarter; that happened during the same period and could also explain the change.	**D.** The test calendar starts on a Monday. That visible detail is part of the scene, not another explanation of the change.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 133

Level 5

The grocery chain tried adding larger unit-price labels on shelf tags. Shopper overpayment complaints fell by 27% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A local consumer group ran a price-literacy campaign; that happened during the same period and could also explain the change.
C. The shelf labels use bold black numbers. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 134

Level 5

The library tried waiving late fines for children's books. Library card renewals rose by 19% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The library also opened on Sundays; that happened during the same period and could also explain the change.	**B.** The children's-book checkout desk moved six feet. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 135

Level 5

The platform tried requiring two-factor login for site administrators. Admin account takeovers fell by 44% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The login button changed from green to blue. That visible detail is part of the scene, not another explanation of the change.	**D.** Some high-risk admin accounts were removed earlier; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 136

Level 5

The neighborhood association tried adding brighter LED streetlights on Maple Street. Reported thefts fell by 12% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The new light poles are made of aluminum. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. Police patrols increased during the same period; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 137

Level 5

The university tried expanding peer tutoring in statistics. Course pass rates rose by 11% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The tutoring room has new chairs. That visible detail is part of the scene, not another explanation of the change.	**D.** The final exam was also shortened; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 138

Level 5

The restaurant group tried showing calorie labels on printed lunch menus. Dessert orders fell by 16% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The lunch menus are printed on thicker paper. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. Dessert prices increased at the same time; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 139

Level 5

The bank tried sending overdraft warning texts before fees post. Overdraft fees fell by 24% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The bank also changed its fee grace period; that happened during the same period and could also explain the change.	**B.** The warning texts arrive from a short code. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 140

Level 5

The park service tried using timed-entry passes for weekend trail visits. Trail crowding complaints fell by 33% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** A nearby trail reopened that month; that happened during the same period and could also explain the change.
C. The digital passes include a small trail map. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 141

Level 5

The museum tried offering free admission on Fridays. Family visits rose by 29% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The Friday tickets are scanned at the east door. That visible detail is part of the scene, not another explanation of the change.
C. A new children's exhibit opened the same week; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 142

Level 5

The sports league tried adding mandatory sideline concussion checks. Repeat head injuries fell by 21% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The concussion checklist is printed on yellow paper. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The league also shortened the season; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 143

Level 5

The nonprofit tried sending donation receipts within one day. Donor retention rose by 14% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The nonprofit also launched a matching campaign; that happened during the same period and could also explain the change.	**B.** The receipt email subject line changed. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 144

Level 5

The warehouse tried offering monthly lifting-safety and ergonomic training. Back-injury claims fell by 20% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The training room has a ceiling-mounted projector. That visible detail is part of the scene, not another explanation of the change.	**B.** New lifting equipment arrived that quarter; that happened during the same period and could also explain the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 145

Level 5

The city sanitation office tried placing compost bins in apartment lobbies. Landfill waste from participating buildings fell by 17% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The lobby compost bins have foot pedals. That visible detail is part of the scene, not another explanation of the change.
C. Trash pickup schedules also changed; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 146

Level 5

The app maker tried making new user profiles private by default. Publicly visible profiles fell by 48% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The privacy screen uses a shield icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The app also deleted inactive accounts; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 147

Level 5

The clinic tried reserving same-day appointment slots. Patient no-show rates fell by 13% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The appointment cards are white. That visible detail is part of the scene, not another explanation of the change.
C. The clinic also began reminder calls; that happened during the same period and could also explain the change.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 148

Level 5

The airline tried boarding passengers by seat zone. Average boarding time fell by 9% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The result is reported as a percentage, which describes what happened but not why it happened.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The gate signs are backlit. That visible detail is part of the scene, not another explanation of the change.	**D.** The airline also reduced carry-on size limits; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 149

Level 5

The landlord tried launching an online apartment repair portal. Unresolved repair requests fell by 26% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The landlord hired two additional repair technicians; that happened during the same period and could also explain the change.
C. The repair portal uses a house logo. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 150

Level 5

The cafeteria tried moving fruit bowls to the front of the cafeteria line. Fruit purchases rose by 23% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. A fruit discount started that week; that happened during the same period and could also explain the change.	**B.** The fruit bowls are ceramic. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 151

Level 5

The call center tried giving support agents weekly script coaching. Customer complaint rates fell by 18% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The coaching slides use blue headers. That visible detail is part of the scene, not another explanation of the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The call queue was also shortened; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 152

Level 5

The water utility tried sending automatic household water-leak alerts. Average household water use fell by 10% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The water-leak alert screen includes a blue droplet icon. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. A rainy season began during the study; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 153

Level 5

The police department tried sending body-camera activation reminders before patrol shifts. Missing-camera-footage reports fell by 35% in the four weeks after the plan began compared with the four weeks before it. Taylor says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The department also updated supervisor reviews; that happened during the same period and could also explain the change.
C. The reminder tone is two beeps. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 154

Level 5

The election office tried offering online mail-ballot tracking. Phone calls asking ballot status fell by 42% in the four weeks after the plan began compared with the four weeks before it. Morgan says, "The plan caused the change." Which other explanation also fits the facts?

A. The office also expanded its phone staff; that happened during the same period and could also explain the change.	**B.** The ballot-tracking page uses county colors. That visible detail is part of the scene, not another explanation of the change.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 155

Level 5

The tutoring app tried sending spaced-review prompts for language vocabulary. Vocabulary retention quiz scores rose by 12% in the four weeks after the plan began compared with the four weeks before it. Casey says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The review prompts use a bell icon. That visible detail is part of the scene, not another explanation of the change.	**D.** The app also changed the quiz format; that happened during the same period and could also explain the change.

Answer: D. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is D because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

Question 156

Level 5

The gym tried offering a beginner gym orientation. New-member cancellations fell by 19% in the four weeks after the plan began compared with the four weeks before it. Jordan says, "The plan caused the change." Which other explanation also fits the facts?

A. The orientation mats are black. That visible detail is part of the scene, not another explanation of the change.	**B.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.
C. The gym also discounted annual plans; that happened during the same period and could also explain the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: C. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is C because it fits the facts without assuming the original explanation is the only one.

A. Not correct. A scene detail may be true, but it does not explain why the result changed.

B. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

C. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 157

Level 5

The insurer tried sending weekly safe-driving feedback. Reported minor crashes fell by 8% in the four weeks after the plan began compared with the four weeks before it. Riley says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** Fuel prices changed driving patterns that month; that happened during the same period and could also explain the change.
C. The feedback dashboard uses star ratings. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Question 158

Level 5

The newsroom tried placing corrections at the top of articles. Reader trust ratings rose by 7% in the four weeks after the plan began compared with the four weeks before it. Maya says, "The plan caused the change." Which other explanation also fits the facts?

A. The newsroom also hired a public editor; that happened during the same period and could also explain the change.	**B.** The correction box has a gray border. That visible detail is part of the scene, not another explanation of the change.
C. The result is reported as a percentage, which describes what happened but not why it happened.	**D.** The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A scene detail may be true, but it does not explain why the result changed.

C. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

D. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

Question 159

Level 5

The farmers market tried requiring clearer price signs at vendor stalls. Price disputes fell by 28% in the four weeks after the plan began compared with the four weeks before it. Sam says, "The plan caused the change." Which other explanation also fits the facts?

A. The market also added a weekend help desk; that happened during the same period and could also explain the change.	**B.** The result is reported as a percentage, which describes what happened but not why it happened.
C. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**D.** The stall price signs are laminated. That visible detail is part of the scene, not another explanation of the change.

Answer: A. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is A because it fits the facts without assuming the original explanation is the only one.

A. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

B. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

C. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

D. Not correct. A scene detail may be true, but it does not explain why the result changed.

Question 160

Level 5

The hotel tried sending quiet-hours text reminders to hotel guests. Noise complaints from guest rooms fell by 30% in the four weeks after the plan began compared with the four weeks before it. Avery says, "The plan caused the change." Which other explanation also fits the facts?

A. The plan was discussed before the result changed, which gives timing rather than another possible cause during that period or separate the plan from other changes.	**B.** The hotel also changed room assignments; that happened during the same period and could also explain the change.
C. The quiet-hours text reminder uses a small moon icon. That visible detail is part of the scene, not another explanation of the change.	**D.** The result is reported as a percentage, which describes what happened but not why it happened.

Answer: B. A good alternative explanation fits the same facts without assuming the first cause is right.

How to work it out. To uncover the answer, keep the observed result fixed and test which option gives another plausible cause. The correct choice is B because it fits the facts without assuming the original explanation is the only one.

A. Not correct. Timing tells when things happened, but it does not give a separate cause that could explain the change.

B. Correct. This explanation fits the same facts without assuming the proposed plan caused the result.

C. Not correct. A scene detail may be true, but it does not explain why the result changed.

D. Not correct. A percentage describes the result, but it does not give another explanation for why the result happened.

Skill 14

Recognize Cognitive Biases

What Bias Is Showing?

Name the thinking bias shown in a choice. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	What mental pull is shaping this judgment?
Why it matters	Biases are not just mistakes in arguments; they are patterns in attention, memory, confidence, and desire that shape judgment before an argument is even spoken.
Conceptual core	Cognitive biases are patterns in attention, memory, confidence, motivation, and social influence. Students should learn that bias does not mean stupidity or bad character; it means a normal mental shortcut is distorting judgment. The skill is to identify the pull: toward confirming what we already believe, following the group, protecting past effort, anchoring on the first number, or trusting what is easiest to recall.
Student method	Identify what is pulling the person's thinking off course: confirming a prior view, following the crowd, anchoring on a first number, protecting sunk costs, favoring the familiar, or overestimating certainty.
Analogy	A cognitive bias is like a lens tint. The scene is still there, but the tint changes what stands out and what fades.
Assessment focus	A good answer identifies the bias pattern shown by the person's thinking and distinguishes it from nearby labels.
Resource note	The quiz feedback links bias items to corresponding CogBias articles when a direct article match is available.

Teaching Sequence

1. Identify what the thinker is drawn toward or away from.

2. Separate evidence problems from mind-pattern problems.

3. Match the pattern to the bias label.

4. Suggest a debiasing move, such as seeking disconfirming evidence or resetting the anchor.

Common Confusions To Watch For

1. Students may label any mistake as bias without naming the mental pattern.

2. Students may confuse a fallacy in an argument with a bias in judgment.

3. Students may treat bias as something only other people have.

Teacher Prompts

1. What is pulling the person's attention?

2. What information is being overweighted or ignored?

3. What would a more balanced thinking move look like?

Worked Example

Scenario	After deciding a study app is helpful, a student reads only positive reviews and skips detailed negative reviews.
Teacher think-aloud	The student is filtering information to support a prior belief. That is confirmation bias, and the correction is to actively inspect evidence on the other side.
Student takeaway	Bias labels should point to a specific mental pull.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. After buying a study app, Sam reads six glowing reviews and skips four detailed critical reviews because 'they will only make me doubt my choice'. Sam concludes the app must improve learning. No learning results have been collected.

What To Do

1. Identify the evidence Sam selects and the evidence Sam avoids, and explain the direction of the preference.

2. Write a three-step checking plan: include both kinds of reviews, use the same quality criteria for them, and collect a learning measure rather than relying only on praise.

3. Name a specific learning measure, such as a delayed quiz on comparable material, and say why review popularity alone is insufficient.

Check before reading the answer. Does your plan make it possible to discover that the purchase was unhelpful, or only reassure Sam?

Model Answer

Sam favours praise that confirms the purchase and avoids criticism that could challenge it. Plan: read all ten reviews; assess each for relevant experience and checkable evidence using the same criteria; compare delayed-quiz performance on comparable material studied with and without the app under similar conditions. Positive reviews show approval, not necessarily better learning.

Why it is adequate. It describes the selective attention and turns a vague request to 'be unbiased' into concrete checks capable of revealing a mistake.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

In a discussion about evening bus service for late-shift workers, Riley reads only comments praising the plan to extend evening bus service until midnight and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Motivated reasoning	**B.** Sunk cost bias
C. Confirmation bias	**D.** Anchoring

Answer: C. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

C. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

Question 2

Level 1

In a discussion about classroom phone lockers, Maya hears one vivid story about ninth-grade students and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Availability bias	**B.** Overconfidence bias
C. Bandwagon effect	**D.** Status quo bias

Answer: A. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Availability bias names the bias pattern shown by the person's thinking.

A. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

Question 3

Level 1

In a discussion about medication reminder texts for older patients, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Bandwagon effect	**B.** Status quo bias
C. Overconfidence bias	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 4

Level 1

In a discussion about a four-day workweek test for software engineers, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Confirmation bias	**B.** Anchoring
C. Sunk cost bias	**D.** Motivated reasoning

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

Question 5

Level 1

In a discussion about larger grocery unit-price labels, Taylor predicts exact results from adding larger unit-price labels on shelf tags even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Confirmation bias	**B.** Overconfidence bias
C. Availability bias	**D.** Status quo bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

Question 6

Level 1

In a discussion about late fines on children's books, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Availability bias
C. Sunk cost bias	**D.** Motivated reasoning

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

Question 7

Level 1

In a discussion about two-factor login for site administrators, Casey praises weak evidence supporting requiring two-factor login for site administrators because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Availability bias	**B.** Status quo bias
C. Bandwagon effect	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 8

Level 1

In a discussion about brighter streetlights on Maple Street, Jordan supports adding brighter LED streetlights on Maple Street after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Sunk cost bias	**B.** Availability bias
C. Bandwagon effect	**D.** Overconfidence bias

Answer: C. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows bandwagon effect.
Study link: CogBias - Availability heuristic

C. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

Question 9

Level 1

In a discussion about peer tutoring for first-year statistics students, Riley reads only comments praising the plan to expand peer tutoring in statistics and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Status quo bias	**B.** Confirmation bias
C. Sunk cost bias	**D.** Motivated reasoning

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

Question 10

Level 1

In a discussion about calorie labels on restaurant menus, Maya hears one vivid story about lunch customers and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Availability bias	**B.** Status quo bias
C. Anchoring	**D.** Motivated reasoning

Answer: A. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Availability bias names the bias pattern shown by the person's thinking.

A. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows availability bias.
Study link: CogBias - Motivated reasoning

Question 11

Level 1

In a discussion about bank overdraft warning texts, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Anchoring	**B.** Bandwagon effect
C. Sunk cost bias	**D.** Motivated reasoning

Answer: A. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Anchoring names the bias pattern shown by the person's thinking.

A. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

Question 12

Level 1

In a discussion about timed-entry passes for weekend park trails, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Motivated reasoning	**B.** Confirmation bias
C. Sunk cost bias	**D.** Anchoring

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

Question 13

Level 1

In a discussion about free Friday museum admission, Taylor predicts exact results from offering free admission on Fridays even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Confirmation bias	**B.** Status quo bias
C. Overconfidence bias	**D.** Sunk cost bias

Answer: C. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

C. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

Question 14

Level 1

In a discussion about youth soccer concussion checks, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Confirmation bias	**B.** Motivated reasoning
C. Availability bias	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 15

Level 1

In a discussion about same-day donation receipts, Casey praises weak evidence supporting sending donation receipts within one day because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Status quo bias	**B.** Bandwagon effect
C. Motivated reasoning	**D.** Anchoring

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

Question 16

Level 1

In a discussion about warehouse ergonomic training, Jordan supports offering monthly lifting-safety and ergonomic training after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Anchoring	**B.** Status quo bias
C. Confirmation bias	**D.** Bandwagon effect

Answer: D. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

D. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

Question 17

Level 1

In a discussion about apartment-lobby compost bins, Riley reads only comments praising the plan to place compost bins in apartment lobbies and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Sunk cost bias
C. Bandwagon effect	**D.** Availability bias

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

Question 18

Level 1

In a discussion about private-by-default app profiles, Maya hears one vivid story about new app users and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Sunk cost bias	**B.** Availability bias
C. Confirmation bias	**D.** Bandwagon effect

Answer: B. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

B. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

Question 19

Level 1

In a discussion about same-day clinic appointment slots, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Motivated reasoning	**B.** Availability bias
C. Anchoring	**D.** Bandwagon effect

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

Question 20

Level 1

In a discussion about seat-zone airline boarding, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Motivated reasoning
C. Bandwagon effect	**D.** Anchoring

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

Question 21

Level 1

In a discussion about an online apartment repair portal, Taylor predicts exact results from launching an online apartment repair portal even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Status quo bias	**B.** Overconfidence bias
C. Sunk cost bias	**D.** Bandwagon effect

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

Question 22

Level 1

In a discussion about fruit placement in a school cafeteria line, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Availability bias	**B.** Motivated reasoning
C. Confirmation bias	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 23

Level 1

In a discussion about weekly call-center script coaching, Casey praises weak evidence supporting giving support agents weekly script coaching because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Overconfidence bias	**D.** Bandwagon effect

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

Question 24

Level 1

In a discussion about household water-leak alerts, Jordan supports sending automatic household water-leak alerts after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Motivated reasoning
C. Anchoring	**D.** Sunk cost bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

Question 25

Level 1

In a discussion about body-camera activation reminders, Riley reads only comments praising the plan to send body-camera activation reminders before patrol shifts and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Status quo bias	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 26

Level 1

In a discussion about county mail-ballot tracking, Maya hears one vivid story about mail voters and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Status quo bias	**B.** Motivated reasoning
C. Availability bias	**D.** Anchoring

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows availability bias.
Study link: CogBias - Motivated reasoning

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

Question 27

Level 1

In a discussion about language-learning spaced-review prompts, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Anchoring	**B.** Overconfidence bias
C. Bandwagon effect	**D.** Motivated reasoning

Answer: A. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Anchoring names the bias pattern shown by the person's thinking.

A. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

Question 28

Level 1

In a discussion about a beginner gym orientation, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Status quo bias	**B.** Sunk cost bias
C. Confirmation bias	**D.** Anchoring

Answer: B. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows sunk cost bias.
Study link: CogBias - Status quo bias

B. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

Question 29

Level 1

In a discussion about safe-driving feedback for policyholders, Taylor predicts exact results from sending weekly safe-driving feedback even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Availability bias	**B.** Anchoring
C. Bandwagon effect	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 30

Level 1

In a discussion about top-of-article correction boxes, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Sunk cost bias	**B.** Status quo bias
C. Availability bias	**D.** Bandwagon effect

Answer: B. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

B. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

Question 31

Level 1

In a discussion about clearer farmers market price signs, Casey praises weak evidence supporting requiring clearer price signs at vendor stalls because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Confirmation bias	**B.** Anchoring
C. Bandwagon effect	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 32

Level 1

In a discussion about hotel quiet-hours text reminders, Jordan supports sending quiet-hours text reminders to hotel guests after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Motivated reasoning	**B.** Bandwagon effect
C. Anchoring	**D.** Sunk cost bias

Answer: B. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

B. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

In a discussion about evening bus service for late-shift workers, Maya hears one vivid story about late-shift workers and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Availability bias	**B.** Sunk cost bias
C. Status quo bias	**D.** Motivated reasoning

Answer: A. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Availability bias names the bias pattern shown by the person's thinking.

A. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows availability bias.
Study link: CogBias - Motivated reasoning

Question 34

Level 2

In a discussion about classroom phone lockers, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Sunk cost bias	**B.** Anchoring
C. Motivated reasoning	**D.** Overconfidence bias

Answer: B. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

B. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

Question 35

Level 2

In a discussion about medication reminder texts for older patients, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Confirmation bias	**B.** Anchoring
C. Sunk cost bias	**D.** Availability bias

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

Question 36

Level 2

In a discussion about a four-day workweek test for software engineers, Taylor predicts exact results from testing a Monday-through-Thursday workweek even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Confirmation bias	**B.** Motivated reasoning
C. Anchoring	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 37

Level 2

In a discussion about larger grocery unit-price labels, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Availability bias
C. Anchoring	**D.** Sunk cost bias

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

Question 38

Level 2

In a discussion about late fines on children's books, Casey praises weak evidence supporting waiving late fines for children's books because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Bandwagon effect	**B.** Motivated reasoning
C. Overconfidence bias	**D.** Availability bias

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

Question 39

Level 2

In a discussion about two-factor login for site administrators, Jordan supports requiring two-factor login for site administrators after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Overconfidence bias	**B.** Confirmation bias
C. Bandwagon effect	**D.** Sunk cost bias

Answer: C. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

C. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

Question 40

Level 2

In a discussion about brighter streetlights on Maple Street, Riley reads only comments praising the plan to add brighter LED streetlights on Maple Street and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Motivated reasoning	**B.** Availability bias
C. Overconfidence bias	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 41

Level 2

In a discussion about peer tutoring for first-year statistics students, Maya hears one vivid story about first-year statistics students and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Confirmation bias	**B.** Bandwagon effect
C. Availability bias	**D.** Anchoring

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

Question 42

Level 2

In a discussion about calorie labels on restaurant menus, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Overconfidence bias	**B.** Bandwagon effect
C. Motivated reasoning	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 43

Level 2

In a discussion about bank overdraft warning texts, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Bandwagon effect	**B.** Sunk cost bias
C. Availability bias	**D.** Anchoring

Answer: B. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

B. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

Question 44

Level 2

In a discussion about timed-entry passes for weekend park trails, Taylor predicts exact results from using timed-entry passes for weekend trail visits even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Overconfidence bias	**B.** Bandwagon effect
C. Availability bias	**D.** Anchoring

Answer: A. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

Question 45

Level 2

In a discussion about free Friday museum admission, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Availability bias	**B.** Bandwagon effect
C. Confirmation bias	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 46

Level 2

In a discussion about youth soccer concussion checks, Casey praises weak evidence supporting adding mandatory sideline concussion checks because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Confirmation bias	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Anchoring

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

Question 47

Level 2

In a discussion about same-day donation receipts, Jordan supports sending donation receipts within one day after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Status quo bias	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Motivated reasoning

Answer: B. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

B. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

Question 48

Level 2

In a discussion about warehouse ergonomic training, Riley reads only comments praising the plan to offer monthly lifting-safety and ergonomic training and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Availability bias
C. Status quo bias	**D.** Bandwagon effect

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

Question 49

Level 2

In a discussion about apartment-lobby compost bins, Maya hears one vivid story about apartment residents and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Overconfidence bias	**B.** Confirmation bias
C. Bandwagon effect	**D.** Availability bias

Answer: D. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

D. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

Question 50

Level 2

In a discussion about private-by-default app profiles, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Bandwagon effect	**B.** Availability bias
C. Anchoring	**D.** Overconfidence bias

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

Question 51

Level 2

In a discussion about same-day clinic appointment slots, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Confirmation bias	**B.** Sunk cost bias
C. Bandwagon effect	**D.** Availability bias

Answer: B. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

B. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

Question 52

Level 2

In a discussion about seat-zone airline boarding, Taylor predicts exact results from boarding passengers by seat zone even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Overconfidence bias	**B.** Anchoring
C. Bandwagon effect	**D.** Status quo bias

Answer: A. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

Question 53

Level 2

In a discussion about an online apartment repair portal, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Overconfidence bias	**B.** Anchoring
C. Status quo bias	**D.** Availability bias

Answer: C. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows status quo bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

C. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

Question 54

Level 2

In a discussion about fruit placement in a school cafeteria line, Casey praises weak evidence supporting moving fruit bowls to the front of the cafeteria line because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Confirmation bias
C. Overconfidence bias	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 55

Level 2

In a discussion about weekly call-center script coaching, Jordan supports giving support agents weekly script coaching after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Overconfidence bias
C. Anchoring	**D.** Availability bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows bandwagon effect.
Study link: CogBias - Availability heuristic

Question 56

Level 2

In a discussion about household water-leak alerts, Riley reads only comments praising the plan to send automatic household water-leak alerts and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Motivated reasoning	**B.** Confirmation bias
C. Status quo bias	**D.** Overconfidence bias

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

Question 57

Level 2

In a discussion about body-camera activation reminders, Maya hears one vivid story about patrol officers and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Overconfidence bias	**B.** Bandwagon effect
C. Availability bias	**D.** Anchoring

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

Question 58

Level 2

In a discussion about county mail-ballot tracking, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Motivated reasoning	**B.** Overconfidence bias
C. Sunk cost bias	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 59

Level 2

In a discussion about language-learning spaced-review prompts, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Motivated reasoning

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

Question 60

Level 2

In a discussion about a beginner gym orientation, Taylor predicts exact results from offering a beginner gym orientation even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Sunk cost bias	**B.** Overconfidence bias
C. Availability bias	**D.** Confirmation bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

Question 61

Level 2

In a discussion about safe-driving feedback for policyholders, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Motivated reasoning
C. Confirmation bias	**D.** Availability bias

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

Question 62

Level 2

In a discussion about top-of-article correction boxes, Casey praises weak evidence supporting placing corrections at the top of articles because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Status quo bias	**D.** Bandwagon effect

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

Question 63

Level 2

In a discussion about clearer farmers market price signs, Jordan supports requiring clearer price signs at vendor stalls after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Overconfidence bias	**B.** Status quo bias
C. Sunk cost bias	**D.** Bandwagon effect

Answer: D. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

D. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

Question 64

Level 2

In a discussion about hotel quiet-hours text reminders, Riley reads only comments praising the plan to send quiet-hours text reminders to hotel guests and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Overconfidence bias	**B.** Availability bias
C. Confirmation bias	**D.** Bandwagon effect

Answer: C. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

C. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

In a discussion about evening bus service for late-shift workers, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Motivated reasoning	**B.** Availability bias
C. Sunk cost bias	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 66

Level 3

In a discussion about classroom phone lockers, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Confirmation bias	**B.** Bandwagon effect
C. Sunk cost bias	**D.** Availability bias

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

Question 67

Level 3

In a discussion about medication reminder texts for older patients, Taylor predicts exact results from sending medication reminder texts before evening doses even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Motivated reasoning	**B.** Overconfidence bias
C. Anchoring	**D.** Sunk cost bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

Question 68

Level 3

In a discussion about a four-day workweek test for software engineers, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Anchoring
C. Confirmation bias	**D.** Overconfidence bias

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows status quo bias.
Study link: CogBias - Overconfidence effect

Question 69

Level 3

In a discussion about larger grocery unit-price labels, Casey praises weak evidence supporting adding larger unit-price labels on shelf tags because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Sunk cost bias	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows motivated reasoning.
Study link: CogBias - Sunk cost effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 70

Level 3

In a discussion about late fines on children's books, Jordan supports waiving late fines for children's books after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Overconfidence bias	**B.** Anchoring
C. Bandwagon effect	**D.** Confirmation bias

Answer: C. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

C. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

Question 71

Level 3

In a discussion about two-factor login for site administrators, Riley reads only comments praising the plan to require two-factor login for site administrators and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Overconfidence bias	**B.** Confirmation bias
C. Bandwagon effect	**D.** Availability bias

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

Question 72

Level 3

In a discussion about brighter streetlights on Maple Street, Maya hears one vivid story about residents on Maple Street and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Availability bias	**B.** Status quo bias
C. Anchoring	**D.** Bandwagon effect

Answer: A. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Availability bias names the bias pattern shown by the person's thinking.

A. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

Question 73

Level 3

In a discussion about peer tutoring for first-year statistics students, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Bandwagon effect	**B.** Status quo bias
C. Overconfidence bias	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 74

Level 3

In a discussion about calorie labels on restaurant menus, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Overconfidence bias	**B.** Confirmation bias
C. Sunk cost bias	**D.** Availability bias

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows sunk cost bias.
Study link: CogBias - Confirmation bias

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

Question 75

Level 3

In a discussion about bank overdraft warning texts, Taylor predicts exact results from sending overdraft warning texts before fees post even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Overconfidence bias	**B.** Status quo bias
C. Sunk cost bias	**D.** Motivated reasoning

Answer: A. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

Question 76

Level 3

In a discussion about timed-entry passes for weekend park trails, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Confirmation bias	**B.** Status quo bias
C. Bandwagon effect	**D.** Overconfidence bias

Answer: B. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

B. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows status quo bias.
Study link: CogBias - Overconfidence effect

Question 77

Level 3

In a discussion about free Friday museum admission, Casey praises weak evidence supporting offering free admission on Fridays because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Availability bias	**B.** Anchoring
C. Motivated reasoning	**D.** Status quo bias

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

Question 78

Level 3

In a discussion about youth soccer concussion checks, Jordan supports adding mandatory sideline concussion checks after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Motivated reasoning	**B.** Availability bias
C. Sunk cost bias	**D.** Bandwagon effect

Answer: D. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows bandwagon effect.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

D. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

Question 79

Level 3

In a discussion about same-day donation receipts, Riley reads only comments praising the plan to send donation receipts within one day and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Anchoring
C. Availability bias	**D.** Sunk cost bias

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

Question 80

Level 3

In a discussion about warehouse ergonomic training, Maya hears one vivid story about warehouse staff and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Anchoring	**B.** Availability bias
C. Overconfidence bias	**D.** Status quo bias

Answer: B. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

B. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

Question 81

Level 3

In a discussion about apartment-lobby compost bins, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Availability bias	**B.** Status quo bias
C. Anchoring	**D.** Overconfidence bias

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

Question 82

Level 3

In a discussion about private-by-default app profiles, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Bandwagon effect	**B.** Availability bias
C. Motivated reasoning	**D.** Sunk cost bias

Answer: D. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

D. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

Question 83

Level 3

In a discussion about same-day clinic appointment slots, Taylor predicts exact results from reserving same-day appointment slots even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Confirmation bias	**B.** Availability bias
C. Overconfidence bias	**D.** Sunk cost bias

Answer: C. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

C. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

Question 84

Level 3

In a discussion about seat-zone airline boarding, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Bandwagon effect	**B.** Availability bias
C. Sunk cost bias	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 85

Level 3

In a discussion about an online apartment repair portal, Casey praises weak evidence supporting launching an online apartment repair portal because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Availability bias	**D.** Confirmation bias

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

Question 86

Level 3

In a discussion about fruit placement in a school cafeteria line, Jordan supports moving fruit bowls to the front of the cafeteria line after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Overconfidence bias
C. Availability bias	**D.** Motivated reasoning

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows bandwagon effect.
Study link: CogBias - Availability heuristic

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

Question 87

Level 3

In a discussion about weekly call-center script coaching, Riley reads only comments praising the plan to give support agents weekly script coaching and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Overconfidence bias	**B.** Anchoring
C. Motivated reasoning	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 88

Level 3

In a discussion about household water-leak alerts, Maya hears one vivid story about local homeowners and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Anchoring	**B.** Confirmation bias
C. Availability bias	**D.** Overconfidence bias

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

Question 89

Level 3

In a discussion about body-camera activation reminders, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Bandwagon effect	**B.** Anchoring
C. Confirmation bias	**D.** Sunk cost bias

Answer: B. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

B. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows anchoring.
Study link: CogBias - Confirmation bias

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

Question 90

Level 3

In a discussion about county mail-ballot tracking, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Anchoring
C. Availability bias	**D.** Bandwagon effect

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

Question 91

Level 3

In a discussion about language-learning spaced-review prompts, Taylor predicts exact results from sending spaced-review prompts for language vocabulary even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Anchoring	**B.** Sunk cost bias
C. Confirmation bias	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 92

Level 3

In a discussion about a beginner gym orientation, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Bandwagon effect	**B.** Motivated reasoning
C. Status quo bias	**D.** Sunk cost bias

Answer: C. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

C. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

Question 93

Level 3

In a discussion about safe-driving feedback for policyholders, Casey praises weak evidence supporting sending weekly safe-driving feedback because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Status quo bias	**B.** Motivated reasoning
C. Sunk cost bias	**D.** Confirmation bias

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows motivated reasoning.
Study link: CogBias - Sunk cost effect

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

Question 94

Level 3

In a discussion about top-of-article correction boxes, Jordan supports placing corrections at the top of articles after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Availability bias
C. Sunk cost bias	**D.** Status quo bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows bandwagon effect.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

Question 95

Level 3

In a discussion about clearer farmers market price signs, Riley reads only comments praising the plan to require clearer price signs at vendor stalls and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Status quo bias
C. Availability bias	**D.** Overconfidence bias

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

Question 96

Level 3

In a discussion about hotel quiet-hours text reminders, Maya hears one vivid story about overnight hotel guests and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Overconfidence bias	**B.** Availability bias
C. Sunk cost bias	**D.** Status quo bias

Answer: B. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

B. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

In a discussion about evening bus service for late-shift workers, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Status quo bias
C. Bandwagon effect	**D.** Anchoring

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows sunk cost bias.
Study link: CogBias - Status quo bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

Question 98

Level 4

In a discussion about classroom phone lockers, Taylor predicts exact results from requiring phone lockers during class even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Availability bias	**B.** Overconfidence bias
C. Bandwagon effect	**D.** Sunk cost bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

Question 99

Level 4

In a discussion about medication reminder texts for older patients, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Confirmation bias	**B.** Availability bias
C. Status quo bias	**D.** Overconfidence bias

Answer: C. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

C. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows status quo bias.
Study link: CogBias - Overconfidence effect

Question 100

Level 4

In a discussion about a four-day workweek test for software engineers, Casey praises weak evidence supporting testing a Monday-through-Thursday workweek because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Availability bias
C. Overconfidence bias	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 101

Level 4

In a discussion about larger grocery unit-price labels, Jordan supports adding larger unit-price labels on shelf tags after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Sunk cost bias
C. Anchoring	**D.** Confirmation bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

Question 102

Level 4

In a discussion about late fines on children's books, Riley reads only comments praising the plan to waive late fines for children's books and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Bandwagon effect	**B.** Confirmation bias
C. Sunk cost bias	**D.** Overconfidence bias

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

Question 103

Level 4

In a discussion about two-factor login for site administrators, Maya hears one vivid story about site administrators and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Anchoring	**B.** Confirmation bias
C. Availability bias	**D.** Sunk cost bias

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

Question 104

Level 4

In a discussion about brighter streetlights on Maple Street, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Status quo bias	**B.** Confirmation bias
C. Overconfidence bias	**D.** Anchoring

Answer: D. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows anchoring.
Study link: CogBias - Confirmation bias

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

D. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

Question 105

Level 4

In a discussion about peer tutoring for first-year statistics students, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Anchoring
C. Overconfidence bias	**D.** Status quo bias

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows sunk cost bias.
Study link: CogBias - Status quo bias

Question 106

Level 4

In a discussion about calorie labels on restaurant menus, Taylor predicts exact results from showing calorie labels on printed lunch menus even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Anchoring	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Status quo bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

Question 107

Level 4

In a discussion about bank overdraft warning texts, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Anchoring	**B.** Availability bias
C. Motivated reasoning	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 108

Level 4

In a discussion about timed-entry passes for weekend park trails, Casey praises weak evidence supporting using timed-entry passes for weekend trail visits because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Sunk cost bias	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Anchoring

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows motivated reasoning.
Study link: CogBias - Sunk cost effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

Question 109

Level 4

In a discussion about free Friday museum admission, Jordan supports offering free admission on Fridays after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Anchoring	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Status quo bias

Answer: B. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

B. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

Question 110

Level 4

In a discussion about youth soccer concussion checks, Riley reads only comments praising the plan to add mandatory sideline concussion checks and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Availability bias
C. Bandwagon effect	**D.** Sunk cost bias

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

Question 111

Level 4

In a discussion about same-day donation receipts, Maya hears one vivid story about first-time donors and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Anchoring	**B.** Overconfidence bias
C. Confirmation bias	**D.** Availability bias

Answer: D. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

D. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

Question 112

Level 4

In a discussion about warehouse ergonomic training, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Sunk cost bias	**B.** Status quo bias
C. Anchoring	**D.** Bandwagon effect

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

Question 113

Level 4

In a discussion about apartment-lobby compost bins, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Overconfidence bias	**B.** Sunk cost bias
C. Bandwagon effect	**D.** Status quo bias

Answer: B. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

B. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows sunk cost bias.
Study link: CogBias - Status quo bias

Question 114

Level 4

In a discussion about private-by-default app profiles, Taylor predicts exact results from making new user profiles private by default even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Overconfidence bias	**B.** Status quo bias
C. Motivated reasoning	**D.** Availability bias

Answer: A. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows overconfidence bias.
Study link: CogBias - Status quo bias

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

Question 115

Level 4

In a discussion about same-day clinic appointment slots, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Availability bias	**B.** Confirmation bias
C. Motivated reasoning	**D.** Status quo bias

Answer: D. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

D. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

Question 116

Level 4

In a discussion about seat-zone airline boarding, Casey praises weak evidence supporting boarding passengers by seat zone because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Availability bias	**B.** Bandwagon effect
C. Motivated reasoning	**D.** Overconfidence bias

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

Question 117

Level 4

In a discussion about an online apartment repair portal, Jordan supports launching an online apartment repair portal after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Bandwagon effect	**D.** Status quo bias

Answer: C. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

C. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

Question 118

Level 4

In a discussion about fruit placement in a school cafeteria line, Riley reads only comments praising the plan to move fruit bowls to the front of the cafeteria line and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Overconfidence bias	**B.** Motivated reasoning
C. Anchoring	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 119

Level 4

In a discussion about weekly call-center script coaching, Maya hears one vivid story about support agents and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Availability bias	**B.** Anchoring
C. Confirmation bias	**D.** Status quo bias

Answer: A. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Availability bias names the bias pattern shown by the person's thinking.

A. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows availability bias.
Study link: CogBias - Anchoring effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

Question 120

Level 4

In a discussion about household water-leak alerts, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Motivated reasoning	**B.** Anchoring
C. Status quo bias	**D.** Availability bias

Answer: B. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

B. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

Question 121

Level 4

In a discussion about body-camera activation reminders, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Availability bias	**B.** Overconfidence bias
C. Sunk cost bias	**D.** Motivated reasoning

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

Question 122

Level 4

In a discussion about county mail-ballot tracking, Taylor predicts exact results from offering online mail-ballot tracking even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Availability bias	**B.** Sunk cost bias
C. Motivated reasoning	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows overconfidence bias.
Study link: CogBias - Motivated reasoning

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 123

Level 4

In a discussion about language-learning spaced-review prompts, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Confirmation bias
C. Bandwagon effect	**D.** Anchoring

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows status quo bias.
Study link: CogBias - Confirmation bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

Question 124

Level 4

In a discussion about a beginner gym orientation, Casey praises weak evidence supporting offering a beginner gym orientation because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Overconfidence bias	**B.** Motivated reasoning
C. Status quo bias	**D.** Confirmation bias

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

Question 125

Level 4

In a discussion about safe-driving feedback for policyholders, Jordan supports sending weekly safe-driving feedback after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Anchoring
C. Status quo bias	**D.** Confirmation bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

D. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

Question 126

Level 4

In a discussion about top-of-article correction boxes, Riley reads only comments praising the plan to place corrections at the top of articles and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Status quo bias	**B.** Confirmation bias
C. Anchoring	**D.** Sunk cost bias

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

Question 127

Level 4

In a discussion about clearer farmers market price signs, Maya hears one vivid story about weekend farmers market shoppers and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Sunk cost bias	**B.** Status quo bias
C. Confirmation bias	**D.** Availability bias

Answer: D. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

D. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

Question 128

Level 4

In a discussion about hotel quiet-hours text reminders, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Status quo bias	**B.** Motivated reasoning
C. Anchoring	**D.** Sunk cost bias

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

In a discussion about evening bus service for late-shift workers, Taylor predicts exact results from extending evening bus service until midnight even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Confirmation bias	**B.** Bandwagon effect
C. Sunk cost bias	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 130

Level 5

In a discussion about classroom phone lockers, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Availability bias	**B.** Motivated reasoning
C. Status quo bias	**D.** Bandwagon effect

Answer: C. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

C. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

Question 131

Level 5

In a discussion about medication reminder texts for older patients, Casey praises weak evidence supporting sending medication reminder texts before evening doses because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Availability bias	**D.** Status quo bias

Answer: B. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows motivated reasoning.
Study link: CogBias - Anchoring effect

B. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows motivated reasoning.
Study link: CogBias - Availability heuristic

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

Question 132

Level 5

In a discussion about a four-day workweek test for software engineers, Jordan supports testing a Monday-through-Thursday workweek after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Confirmation bias
C. Status quo bias	**D.** Motivated reasoning

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

Question 133

Level 5

In a discussion about larger grocery unit-price labels, Riley reads only comments praising the plan to add larger unit-price labels on shelf tags and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Status quo bias	**B.** Anchoring
C. Bandwagon effect	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows confirmation bias.
Study link: CogBias - Status quo bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 134

Level 5

In a discussion about late fines on children's books, Maya hears one vivid story about families checking out children's books and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Bandwagon effect	**B.** Sunk cost bias
C. Availability bias	**D.** Overconfidence bias

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows availability bias.
Study link: CogBias - Bandwagon effect

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

Question 135

Level 5

In a discussion about two-factor login for site administrators, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Sunk cost bias	**B.** Anchoring
C. Availability bias	**D.** Status quo bias

Answer: B. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

B. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows anchoring.
Study link: CogBias - Status quo bias

Question 136

Level 5

In a discussion about brighter streetlights on Maple Street, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Anchoring
C. Status quo bias	**D.** Bandwagon effect

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows sunk cost bias.
Study link: CogBias - Status quo bias

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

Question 137

Level 5

In a discussion about peer tutoring for first-year statistics students, Taylor predicts exact results from expanding peer tutoring in statistics even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Availability bias	**B.** Overconfidence bias
C. Anchoring	**D.** Sunk cost bias

Answer: B. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

B. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows overconfidence bias.
Study link: CogBias - Sunk cost effect

Question 138

Level 5

In a discussion about calorie labels on restaurant menus, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Status quo bias	**B.** Anchoring
C. Motivated reasoning	**D.** Availability bias

Answer: A. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Status quo bias names the bias pattern shown by the person's thinking.

A. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows status quo bias.
Study link: CogBias - Anchoring effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

Question 139

Level 5

In a discussion about bank overdraft warning texts, Casey praises weak evidence supporting sending overdraft warning texts before fees post because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Bandwagon effect	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Status quo bias

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

Question 140

Level 5

In a discussion about timed-entry passes for weekend park trails, Jordan supports using timed-entry passes for weekend trail visits after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Bandwagon effect	**B.** Confirmation bias
C. Sunk cost bias	**D.** Overconfidence bias

Answer: A. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows bandwagon effect.
Study link: CogBias - Confirmation bias

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

Question 141

Level 5

In a discussion about free Friday museum admission, Riley reads only comments praising the plan to offer free admission on Fridays and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Confirmation bias	**B.** Motivated reasoning
C. Anchoring	**D.** Bandwagon effect

Answer: A. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Confirmation bias names the bias pattern shown by the person's thinking.

A. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows confirmation bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

Question 142

Level 5

In a discussion about youth soccer concussion checks, Maya hears one vivid story about youth soccer players and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Confirmation bias	**B.** Availability bias
C. Sunk cost bias	**D.** Motivated reasoning

Answer: B. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

B. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

C. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows availability bias.
Study link: CogBias - Motivated reasoning

Question 143

Level 5

In a discussion about same-day donation receipts, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Anchoring	**B.** Availability bias
C. Motivated reasoning	**D.** Overconfidence bias

Answer: A. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Anchoring names the bias pattern shown by the person's thinking.

A. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows anchoring.
Study link: CogBias - Motivated reasoning

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

Question 144

Level 5

In a discussion about warehouse ergonomic training, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Availability bias	**B.** Anchoring
C. Sunk cost bias	**D.** Bandwagon effect

Answer: C. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

C. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

Question 145

Level 5

In a discussion about apartment-lobby compost bins, Taylor predicts exact results from placing compost bins in apartment lobbies even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Overconfidence bias	**B.** Confirmation bias
C. Anchoring	**D.** Bandwagon effect

Answer: A. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

B. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows overconfidence bias.
Study link: CogBias - Confirmation bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

Question 146

Level 5

In a discussion about private-by-default app profiles, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Sunk cost bias	**B.** Bandwagon effect
C. Status quo bias	**D.** Motivated reasoning

Answer: C. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows status quo bias.
Study link: CogBias - Sunk cost effect

B. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

C. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

D. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

Question 147

Level 5

In a discussion about same-day clinic appointment slots, Casey praises weak evidence supporting reserving same-day appointment slots because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Confirmation bias	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Sunk cost bias

Answer: C. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows motivated reasoning.
Study link: CogBias - Confirmation bias

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

C. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows motivated reasoning.
Study link: CogBias - Sunk cost effect

Question 148

Level 5

In a discussion about seat-zone airline boarding, Jordan supports boarding passengers by seat zone after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Sunk cost bias	**B.** Status quo bias
C. Anchoring	**D.** Bandwagon effect

Answer: D. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

B. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows bandwagon effect.
Study link: CogBias - Status quo bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows bandwagon effect.
Study link: CogBias - Anchoring effect

D. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

Question 149

Level 5

In a discussion about an online apartment repair portal, Riley reads only comments praising the plan to launch an online apartment repair portal and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Sunk cost bias	**B.** Overconfidence bias
C. Availability bias	**D.** Confirmation bias

Answer: D. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows confirmation bias.
Study link: CogBias - Sunk cost effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows confirmation bias.
Study link: CogBias - Overconfidence effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

D. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

Question 150

Level 5

In a discussion about fruit placement in a school cafeteria line, Maya hears one vivid story about middle-school students and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Status quo bias	**B.** Motivated reasoning
C. Availability bias	**D.** Overconfidence bias

Answer: C. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows availability bias.
Study link: CogBias - Status quo bias

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows availability bias.
Study link: CogBias - Motivated reasoning

C. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

Question 151

Level 5

In a discussion about weekly call-center script coaching, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Bandwagon effect	**B.** Anchoring
C. Overconfidence bias	**D.** Sunk cost bias

Answer: B. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows anchoring.
Study link: CogBias - Bandwagon effect

B. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

Question 152

Level 5

In a discussion about household water-leak alerts, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Sunk cost bias	**B.** Overconfidence bias
C. Motivated reasoning	**D.** Bandwagon effect

Answer: A. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is A because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows sunk cost bias.
Study link: CogBias - Overconfidence effect

C. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

D. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows sunk cost bias.
Study link: CogBias - Bandwagon effect

Question 153

Level 5

In a discussion about body-camera activation reminders, Taylor predicts exact results from sending body-camera activation reminders before patrol shifts even though no similar test has been run. Which thinking bias is shown in Taylor's thinking?

A. Bandwagon effect	**B.** Anchoring
C. Availability bias	**D.** Overconfidence bias

Answer: D. The person shows more certainty than the evidence supports.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Overconfidence bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows overconfidence bias.
Study link: CogBias - Bandwagon effect

B. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows overconfidence bias.
Study link: CogBias - Anchoring effect

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows overconfidence bias.
Study link: CogBias - Availability heuristic

D. Correct. The person shows more certainty than the evidence supports. The choice names the bias shown by the person's thinking.
Study link: CogBias - Overconfidence effect

Question 154

Level 5

In a discussion about county mail-ballot tracking, Morgan rejects the proposal mainly because the current system feels familiar. Which thinking bias is shown in Morgan's thinking?

A. Motivated reasoning	**B.** Status quo bias
C. Bandwagon effect	**D.** Availability bias

Answer: B. The current option is favored because it is already in place.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Status quo bias names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows status quo bias.
Study link: CogBias - Motivated reasoning

B. Correct. The current option is favored because it is already in place. The choice names the bias shown by the person's thinking.
Study link: CogBias - Status quo bias

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows status quo bias.
Study link: CogBias - Bandwagon effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows status quo bias.
Study link: CogBias - Availability heuristic

Question 155

Level 5

In a discussion about language-learning spaced-review prompts, Casey praises weak evidence supporting sending spaced-review prompts for language vocabulary because that conclusion would help Casey's preferred plan. Which thinking bias is shown in Casey's thinking?

A. Status quo bias	**B.** Overconfidence bias
C. Bandwagon effect	**D.** Motivated reasoning

Answer: D. The evaluation is shaped by the desired conclusion.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Motivated reasoning names the bias pattern shown by the person's thinking.

A. Not correct. Status quo bias is a real bias, but it points to a different pattern: the current option is favored because it is already in place. This scenario shows motivated reasoning.
Study link: CogBias - Status quo bias

B. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows motivated reasoning.
Study link: CogBias - Overconfidence effect

C. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows motivated reasoning.
Study link: CogBias - Bandwagon effect

D. Correct. The evaluation is shaped by the desired conclusion. The choice names the bias shown by the person's thinking.
Study link: CogBias - Motivated reasoning

Question 156

Level 5

In a discussion about a beginner gym orientation, Jordan supports offering a beginner gym orientation after seeing that most classmates or coworkers support it, without checking the evidence. Which thinking bias is shown in Jordan's thinking?

A. Motivated reasoning	**B.** Bandwagon effect
C. Overconfidence bias	**D.** Sunk cost bias

Answer: B. The person follows the crowd rather than the reasons.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Bandwagon effect names the bias pattern shown by the person's thinking.

A. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows bandwagon effect.
Study link: CogBias - Motivated reasoning

B. Correct. The person follows the crowd rather than the reasons. The choice names the bias shown by the person's thinking.
Study link: CogBias - Bandwagon effect

C. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows bandwagon effect.
Study link: CogBias - Overconfidence effect

D. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows bandwagon effect.
Study link: CogBias - Sunk cost effect

Question 157

Level 5

In a discussion about safe-driving feedback for policyholders, Riley reads only comments praising the plan to send weekly safe-driving feedback and ignores equally detailed criticism. Which thinking bias is shown in Riley's thinking?

A. Bandwagon effect	**B.** Confirmation bias
C. Anchoring	**D.** Availability bias

Answer: B. The person favors evidence that supports an existing view.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is B because Confirmation bias names the bias pattern shown by the person's thinking.

A. Not correct. Bandwagon effect is a real bias, but it points to a different pattern: the person follows the crowd rather than the reasons. This scenario shows confirmation bias.
Study link: CogBias - Bandwagon effect

B. Correct. The person favors evidence that supports an existing view. The choice names the bias shown by the person's thinking.
Study link: CogBias - Confirmation bias

C. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows confirmation bias.
Study link: CogBias - Anchoring effect

D. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows confirmation bias.
Study link: CogBias - Availability heuristic

Question 158

Level 5

In a discussion about top-of-article correction boxes, Maya hears one vivid story about newsletter readers and assumes that example shows what usually happens. Which thinking bias is shown in Maya's thinking?

A. Overconfidence bias	**B.** Sunk cost bias
C. Confirmation bias	**D.** Availability bias

Answer: D. A memorable example is treated as more common than it may be.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Availability bias names the bias pattern shown by the person's thinking.

A. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows availability bias.
Study link: CogBias - Overconfidence effect

B. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows availability bias.
Study link: CogBias - Sunk cost effect

C. Not correct. Confirmation bias is a real bias, but it points to a different pattern: the person favors evidence that supports an existing view. This scenario shows availability bias.
Study link: CogBias - Confirmation bias

D. Correct. A memorable example is treated as more common than it may be. The choice names the bias shown by the person's thinking.
Study link: CogBias - Availability heuristic

Question 159

Level 5

In a discussion about clearer farmers market price signs, Sam sees a first cost guess of $900,000 for the plan. After that, Sam treats $850,000 as cheap without checking what the plan should cost. Which thinking bias is shown in Sam's thinking?

A. Sunk cost bias	**B.** Availability bias
C. Anchoring	**D.** Overconfidence bias

Answer: C. Judgment is pulled toward the first number encountered.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is C because Anchoring names the bias pattern shown by the person's thinking.

A. Not correct. Sunk cost bias is a real bias, but it points to a different pattern: past unrecoverable costs are allowed to drive the current decision. This scenario shows anchoring.
Study link: CogBias - Sunk cost effect

B. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows anchoring.
Study link: CogBias - Availability heuristic

C. Correct. Judgment is pulled toward the first number encountered. The choice names the bias shown by the person's thinking.
Study link: CogBias - Anchoring effect

D. Not correct. Overconfidence bias is a real bias, but it points to a different pattern: the person shows more certainty than the evidence supports. This scenario shows anchoring.
Study link: CogBias - Overconfidence effect

Question 160

Level 5

In a discussion about hotel quiet-hours text reminders, Avery's team keeps funding the plan because it already spent a year developing it, even after early results look poor. Which thinking bias is shown in Avery's thinking?

A. Anchoring	**B.** Motivated reasoning
C. Availability bias	**D.** Sunk cost bias

Answer: D. Past unrecoverable costs are allowed to drive the current decision.

How to work it out. To uncover the answer, identify the mental pull in the scenario. The correct choice is D because Sunk cost bias names the bias pattern shown by the person's thinking.

A. Not correct. Anchoring is a real bias, but it points to a different pattern: judgment is pulled toward the first number encountered. This scenario shows sunk cost bias.
Study link: CogBias - Anchoring effect

B. Not correct. Motivated reasoning is a real bias, but it points to a different pattern: the evaluation is shaped by the desired conclusion. This scenario shows sunk cost bias.
Study link: CogBias - Motivated reasoning

C. Not correct. Availability bias is a real bias, but it points to a different pattern: a memorable example is treated as more common than it may be. This scenario shows sunk cost bias.
Study link: CogBias - Availability heuristic

D. Correct. Past unrecoverable costs are allowed to drive the current decision. The choice names the bias shown by the person's thinking.
Study link: CogBias - Sunk cost effect

Skill 15

Weigh Tradeoffs and Consequences

What Are the Tradeoffs?

Find the clearest cost, benefit, risk, or second effect. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	What does this choice gain, and what does it give up or risk?
Why it matters	Decisions usually buy one good by spending another. Tradeoff thinking keeps benefits, costs, risks, delays, and second effects in the same frame.
Conceptual core	Tradeoff thinking moves students beyond pro-con lists by asking how goods compete. Time, money, attention, privacy, fairness, speed, safety, accuracy, and flexibility can all be scarce. A tradeoff is not merely a downside; it is a relationship between values or resources. Strong tradeoff answers keep the benefit and the cost in one frame.
Student method	Look for what the plan gains and what it uses up or endangers. A tradeoff is not just a downside; it is the connection between competing values or resources.
Analogy	A tradeoff is a budget for attention, money, time, or risk. Spending in one place leaves less to spend somewhere else.
Assessment focus	A good answer shows the competing benefit and cost, risk, delay, or opportunity cost in the same decision.

Teaching Sequence

1. Identify the main benefit the plan seeks.

2. Identify the resource, value, or opportunity it may use up.

3. Look for second effects on people not centered in the proposal.

4. Avoid answers that mention a cost without linking it to the choice.

Common Confusions To Watch For

1. Students may treat any negative fact as a tradeoff even if it is unrelated.

2. Students may ignore opportunity cost because no money is visibly spent.

3. Students may choose the most emotional consequence rather than the clearest competing value.

Teacher Prompts

1. What is the plan trying to improve?

2. What could get worse, receive less attention, or become riskier?

3. Who benefits, who pays, and who carries the risk?

Worked Example

Scenario	A school wants more test-prep time before exams by reducing open reading time.
Teacher think-aloud	The plan may improve short-term test practice, but it spends time that could support independent reading, curiosity, and long-term literacy. That is the tradeoff.
Student takeaway	A tradeoff names both the gain and what is spent or risked to get it.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. A school has 60 minutes each week for optional study activities. It proposes moving 30 minutes from open reading to test preparation. Teachers expect more exam practice, but no evidence yet shows a score gain. Students who rely on school reading time would lose half that time.

What To Do

1. Make three labelled lines: possible benefit, cost, and affected group. Use the facts and distinguish an expected benefit from a demonstrated result.

2. Propose one alternative allocation of the 60 minutes and explain its tradeoff.

3. Write one question the school should answer before choosing a plan.

Check before reading the answer. Do all allocations total 60 minutes? Have you named who bears the cost rather than calling the proposal simply 'good' or 'bad'?

Model Answer

Possible benefit: more exam practice, with score improvement still unproven. Cost: 30 fewer minutes of open reading. Affected group: especially students dependent on school reading time. An alternative is 15 minutes of preparation and 45 of reading; it preserves more reading but provides less preparation. Ask whether a trial shows gains large enough to justify the lost reading opportunity.

Why it is adequate. It makes the limited resource explicit and compares benefits, costs, and affected students without inventing guaranteed gains.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

The city council can extend evening bus service until midnight, which may reduce late-shift commute complaints. But the plan requires staff time that could be used for other transportation work. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the new buses were repainted blue, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce late-shift commute complaints, while leaving costs and resource limits for later.	**D.** The tradeoff is that the plan may reduce late-shift commute complaints, but it also has the resource cost named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 2

Level 1

The school board can require phone lockers during class, which may reduce classroom disruption reports. But the plan requires staff time that could be used for other education work. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the lockers are installed near the gym, because concrete details are easier to inspect than resource limits.
C. The question is whether reducing classroom disruption reports is worth the resources the plan would use, not just whether the benefit sounds good.	**D.** The decision should focus only on whether the plan might reduce classroom disruption reports, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 3

Level 1

The hospital can send medication reminder texts before evening doses, which may reduce missed-dose reports. But the plan requires staff time that could be used for other health work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the text messages use a green pill icon, because concrete details are easier to inspect than resource limits.	**B.** A fair judgment counts both the possible improvement in missed-dose reports and the resources the plan would use.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce missed-dose reports, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 4

Level 1

The company can test a Monday-through-Thursday workweek, which may reduce staff resignations. But the plan requires staff time that could be used for other workplace work. Which statement best names the tradeoff?

A. The plan may help software engineers, but another useful need may get less support from the same resources.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce staff resignations, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the test calendar starts on a Monday, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 5

Level 1

The grocery chain can add larger unit-price labels on shelf tags, which may reduce shopper overpayment complaints. But the plan requires staff time that could be used for other retail work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce shopper overpayment complaints, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the shelf labels use bold black numbers, because concrete details are easier to inspect than resource limits.	**D.** Both sides stay in view: possible improvement in shopper overpayment complaints and limited resources for other needs.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 6

Level 1

The library can waive late fines for children's books, which may increase library card renewals. But the plan requires staff time that could be used for other public services work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the children's-book checkout desk moved six feet, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The possible gain is increasing library card renewals, and the cost is the resource limit described in the prompt.	**D.** The decision should focus only on whether the plan might increase library card renewals, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 7

Level 1

The platform can require two-factor login for site administrators, which may reduce admin account takeovers. But the plan requires staff time that could be used for other technology work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce admin account takeovers, while leaving costs and resource limits for later.	**B.** The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.
C. The main tradeoff is the visible side detail: the login button changed from green to blue, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 8

Level 1

The neighborhood association can add brighter LED streetlights on Maple Street, which may reduce reported thefts. But the plan requires staff time that could be used for other public safety work. Which statement best names the tradeoff?

A. The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.	**B.** The decision should focus only on whether the plan might reduce reported thefts, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the new light poles are made of aluminum, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 9

Level 1

The university can expand peer tutoring in statistics, which may increase course pass rates. But the plan requires staff time that could be used for other education work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase course pass rates, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the tutoring room has new chairs, because concrete details are easier to inspect than resource limits.	**D.** The possible help is real, but the plan may push another need or group aside while resources are limited.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 10

Level 1

The restaurant group can show calorie labels on printed lunch menus, which may reduce dessert orders. But the plan requires staff time that could be used for other nutrition work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce dessert orders, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the lunch menus are printed on thicker paper, because concrete details are easier to inspect than resource limits.
C. The possible improvement is weighed against the resource limit described in the prompt, not only the upside.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 11

Level 1

The bank can send overdraft warning texts before fees post, which may reduce overdraft fees. But the plan requires staff time that could be used for other finance work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce overdraft fees, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the warning texts arrive from a short code, because concrete details are easier to inspect than resource limits.
C. The tradeoff is between reducing overdraft fees and the resource cost named in the prompt.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 12

Level 1

The park service can use timed-entry passes for weekend trail visits, which may reduce trail crowding complaints. But the plan requires staff time that could be used for other environment work. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce trail crowding complaints, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the digital passes include a small trail map, because concrete details are easier to inspect than resource limits.	**D.** The tradeoff compares the result people want with the resources the plan would take from other work.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 13

Level 1

The museum can offer free admission on Fridays, which may increase family visits. But the plan requires staff time that could be used for other culture work. Which statement best names the tradeoff?

A. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might increase family visits, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the Friday tickets are scanned at the east door, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 14

Level 1

The sports league can add mandatory sideline concussion checks, which may reduce repeat head injuries. But the plan requires staff time that could be used for other sports work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce repeat head injuries, while leaving costs and resource limits for later.	**B.** One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the concussion checklist is printed on yellow paper, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 15

Level 1

The nonprofit can send donation receipts within one day, which may increase donor retention. But the plan requires staff time that could be used for other nonprofit work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase donor retention, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The hoped-for gain and the resource limit are both part of the same choice, not separate questions.	**D.** The main tradeoff is the visible side detail: the receipt email subject line changed, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 16

Level 1

The warehouse can offer monthly lifting-safety and ergonomic training, which may reduce back-injury claims. But the plan requires staff time that could be used for other workplace safety work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the training room has a ceiling-mounted projector, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce back-injury claims, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The warehouse might get a better result, but only by accepting the resource cost described in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 17

Level 1

The city sanitation office can place compost bins in apartment lobbies, which may reduce landfill waste from participating buildings. But the plan requires staff time that could be used for other environment work. Which statement best names the tradeoff?

A. Reducing landfill waste from participating buildings matters, but so do the resources used by the plan and not used elsewhere.	**B.** The main tradeoff is the visible side detail: the lobby compost bins have foot pedals, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce landfill waste from participating buildings, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 18

Level 1

The app maker can make new user profiles private by default, which may reduce publicly visible profiles. But the plan requires staff time that could be used for other technology work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce publicly visible profiles, while leaving costs and resource limits for later.	**B.** The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the privacy screen uses a shield icon, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 19

Level 1

The clinic can reserve same-day appointment slots, which may reduce patient no-show rates. But the plan requires staff time that could be used for other health work. Which statement best names the tradeoff?

A. The decision trades a possible gain for primary-care patients against what may be delayed elsewhere.	**B.** The decision should focus only on whether the plan might reduce patient no-show rates, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the appointment cards are white, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 20

Level 1

The airline can board passengers by seat zone, which may reduce average boarding time. But the plan requires staff time that could be used for other travel work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the gate signs are backlit, because concrete details are easier to inspect than resource limits.	**B.** The upside is reducing average boarding time; the limit is that resources still have to be shared.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce average boarding time, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 21

Level 1

The landlord can launch an online apartment repair portal, which may reduce unresolved repair requests. But the plan requires staff time that could be used for other housing work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce unresolved repair requests, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the repair portal uses a house logo, because concrete details are easier to inspect than resource limits.	**D.** The plan could help with unresolved repair requests, but it would also use limited resources named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 22

Level 1

The cafeteria can move fruit bowls to the front of the cafeteria line, which may increase fruit purchases. But the plan requires staff time that could be used for other food work. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might increase fruit purchases, while leaving costs and resource limits for later.
C. The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.	**D.** The main tradeoff is the visible side detail: the fruit bowls are ceramic, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 23

Level 1

The call center can give support agents weekly script coaching, which may reduce customer complaint rates. But the plan requires staff time that could be used for other customer support work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce customer complaint rates, while leaving costs and resource limits for later.	**B.** The result could improve, but that does not erase the cost side of the decision.
C. The main tradeoff is the visible side detail: the coaching slides use blue headers, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 24

Level 1

The water utility can send automatic household water-leak alerts, which may reduce average household water use. But the plan requires staff time that could be used for other utilities work. Which statement best names the tradeoff?

A. Choosing this plan may help one problem while leaving less support for another useful need.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the water-leak alert screen includes a blue droplet icon, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce average household water use, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 25

Level 1

The police department can send body-camera activation reminders before patrol shifts, which may reduce missing-camera-footage reports. But the plan requires staff time that could be used for other governance work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the reminder tone is two beeps, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce missing-camera-footage reports, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The plan may improve something important, but it still has to compete with other needs for limited support.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 26

Level 1

The election office can offer online mail-ballot tracking, which may reduce phone calls asking ballot status. But the plan requires staff time that could be used for other election administration work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the ballot-tracking page uses county colors, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce phone calls asking ballot status, while leaving costs and resource limits for later.
C. The tradeoff is that the plan may reduce phone calls asking ballot status, but it also has the resource cost named in the prompt.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 27

Level 1

The tutoring app can send spaced-review prompts for language vocabulary, which may increase vocabulary retention quiz scores. But the plan requires staff time that could be used for other learning work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the review prompts use a bell icon, because concrete details are easier to inspect than resource limits.	**B.** The question is whether increasing vocabulary retention quiz scores is worth the resources the plan would use, not just whether the benefit sounds good.
C. The decision should focus only on whether the plan might increase vocabulary retention quiz scores, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 28

Level 1

The gym can offer a beginner gym orientation, which may reduce new-member cancellations. But the plan requires staff time that could be used for other fitness work. Which statement best names the tradeoff?

A. A fair judgment counts both the possible improvement in new-member cancellations and the resources the plan would use.	**B.** The decision should focus only on whether the plan might reduce new-member cancellations, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the orientation mats are black, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 29

Level 1

The insurer can send weekly safe-driving feedback, which may reduce reported minor crashes. But the plan requires staff time that could be used for other insurance work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce reported minor crashes, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the feedback dashboard uses star ratings, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The plan may help auto-insurance policyholders, but another useful need may get less support from the same resources.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 30

Level 1

The newsroom can place corrections at the top of articles, which may increase reader trust ratings. But the plan requires staff time that could be used for other media work. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the correction box has a gray border, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. Both sides stay in view: possible improvement in reader trust ratings and limited resources for other needs.	**D.** The decision should focus only on whether the plan might increase reader trust ratings, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 31

Level 1

The farmers market can require clearer price signs at vendor stalls, which may reduce price disputes. But the plan requires staff time that could be used for other local commerce work. Which statement best names the tradeoff?

A. The possible gain is reducing price disputes, and the cost is the resource limit described in the prompt.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the stall price signs are laminated, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce price disputes, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 32

Level 1

The hotel can send quiet-hours text reminders to hotel guests, which may reduce noise complaints from guest rooms. But the plan requires staff time that could be used for other hospitality work. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce noise complaints from guest rooms, while leaving costs and resource limits for later.	**B.** The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.
C. The main tradeoff is the visible side detail: the quiet-hours text reminder uses a small moon icon, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

The city council can extend evening bus service until midnight, which may reduce late-shift commute complaints. But the plan uses money that could fund a different transportation need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the new buses were repainted blue, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce late-shift commute complaints, while leaving costs and resource limits for later.	**D.** The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 34

Level 2

The school board can require phone lockers during class, which may reduce classroom disruption reports. But the plan uses money that could fund a different education need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lockers are installed near the gym, because concrete details are easier to inspect than resource limits.	**B.** The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce classroom disruption reports, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 35

Level 2

The hospital can send medication reminder texts before evening doses, which may reduce missed-dose reports. But the plan uses money that could fund a different health need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce missed-dose reports, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the text messages use a green pill icon, because concrete details are easier to inspect than resource limits.
C. The possible help is real, but the plan may push another need or group aside while resources are limited.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 36

Level 2

The company can test a Monday-through-Thursday workweek, which may reduce staff resignations. But the plan uses money that could fund a different workplace need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce staff resignations, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the test calendar starts on a Monday, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The possible improvement is weighed against the resource limit described in the prompt, not only the upside.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 37

Level 2

The grocery chain can add larger unit-price labels on shelf tags, which may reduce shopper overpayment complaints. But the plan uses money that could fund a different retail need. Which statement best names the tradeoff?

A. The possible gain is reducing shopper overpayment complaints, and the cost is the resource limit described in the prompt.	**B.** The decision should focus only on whether the plan might reduce shopper overpayment complaints, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the shelf labels use bold black numbers, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 38

Level 2

The library can waive late fines for children's books, which may increase library card renewals. But the plan uses money that could fund a different public services need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase library card renewals, while leaving costs and resource limits for later.	**B.** The tradeoff compares the result people want with the resources the plan would take from other work.
C. The main tradeoff is the visible side detail: the children's-book checkout desk moved six feet, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 39

Level 2

The platform can require two-factor login for site administrators, which may reduce admin account takeovers. But the plan uses money that could fund a different technology need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the login button changed from green to blue, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**D.** The decision should focus only on whether the plan might reduce admin account takeovers, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 40

Level 2

The neighborhood association can add brighter LED streetlights on Maple Street, which may reduce reported thefts. But the plan uses money that could fund a different public safety need. Which statement best names the tradeoff?

A. One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.	**B.** The decision should focus only on whether the plan might reduce reported thefts, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the new light poles are made of aluminum, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 41

Level 2

The university can expand peer tutoring in statistics, which may increase course pass rates. But the plan uses money that could fund a different education need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the tutoring room has new chairs, because concrete details are easier to inspect than resource limits.
C. The hoped-for gain and the resource limit are both part of the same choice, not separate questions.	**D.** The decision should focus only on whether the plan might increase course pass rates, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 42

Level 2

The restaurant group can show calorie labels on printed lunch menus, which may reduce dessert orders. But the plan uses money that could fund a different nutrition need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the lunch menus are printed on thicker paper, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce dessert orders, while leaving costs and resource limits for later.	**D.** The tradeoff is between reducing dessert orders and the resource cost named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 43

Level 2

The bank can send overdraft warning texts before fees post, which may reduce overdraft fees. But the plan uses money that could fund a different finance need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the warning texts arrive from a short code, because concrete details are easier to inspect than resource limits.	**B.** Reducing overdraft fees matters, but so do the resources used by the plan and not used elsewhere.
C. The decision should focus only on whether the plan might reduce overdraft fees, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 44

Level 2

The park service can use timed-entry passes for weekend trail visits, which may reduce trail crowding complaints. But the plan uses money that could fund a different environment need. Which statement best names the tradeoff?

A. The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.	**B.** The main tradeoff is the visible side detail: the digital passes include a small trail map, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce trail crowding complaints, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 45

Level 2

The museum can offer free admission on Fridays, which may increase family visits. But the plan uses money that could fund a different culture need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the Friday tickets are scanned at the east door, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might increase family visits, while leaving costs and resource limits for later.	**D.** The decision trades a possible gain for local families against what may be delayed elsewhere.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 46

Level 2

The sports league can add mandatory sideline concussion checks, which may reduce repeat head injuries. But the plan uses money that could fund a different sports need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce repeat head injuries, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the concussion checklist is printed on yellow paper, because concrete details are easier to inspect than resource limits.
C. The upside is reducing repeat head injuries; the limit is that resources still have to be shared.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 47

Level 2

The nonprofit can send donation receipts within one day, which may increase donor retention. But the plan uses money that could fund a different nonprofit need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The nonprofit might get a better result, but only by accepting the resource cost described in the prompt.
C. The decision should focus only on whether the plan might increase donor retention, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the receipt email subject line changed, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 48

Level 2

The warehouse can offer monthly lifting-safety and ergonomic training, which may reduce back-injury claims. But the plan uses money that could fund a different workplace safety need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce back-injury claims, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the training room has a ceiling-mounted projector, because concrete details are easier to inspect than resource limits.	**D.** The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 49

Level 2

The city sanitation office can place compost bins in apartment lobbies, which may reduce landfill waste from participating buildings. But the plan uses money that could fund a different environment need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The result could improve, but that does not erase the cost side of the decision.
C. The main tradeoff is the visible side detail: the lobby compost bins have foot pedals, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce landfill waste from participating buildings, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 50

Level 2

The app maker can make new user profiles private by default, which may reduce publicly visible profiles. But the plan uses money that could fund a different technology need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the privacy screen uses a shield icon, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce publicly visible profiles, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** Choosing this plan may help one problem while leaving less support for another useful need.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 51

Level 2

The clinic can reserve same-day appointment slots, which may reduce patient no-show rates. But the plan uses money that could fund a different health need. Which statement best names the tradeoff?

A. The plan may improve something important, but it still has to compete with other needs for limited support.	**B.** The decision should focus only on whether the plan might reduce patient no-show rates, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the appointment cards are white, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 52

Level 2

The airline can board passengers by seat zone, which may reduce average boarding time. But the plan uses money that could fund a different travel need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The plan could help with average boarding time, but it would also use limited resources named in the prompt.
C. The main tradeoff is the visible side detail: the gate signs are backlit, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce average boarding time, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 53

Level 2

The landlord can launch an online apartment repair portal, which may reduce unresolved repair requests. But the plan uses money that could fund a different housing need. Which statement best names the tradeoff?

A. The question is whether reducing unresolved repair requests is worth the resources the plan would use, not just whether the benefit sounds good.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce unresolved repair requests, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the repair portal uses a house logo, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 54

Level 2

The cafeteria can move fruit bowls to the front of the cafeteria line, which may increase fruit purchases. But the plan uses money that could fund a different food need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the fruit bowls are ceramic, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might increase fruit purchases, while leaving costs and resource limits for later.
C. A fair judgment counts both the possible improvement in fruit purchases and the resources the plan would use.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 55

Level 2

The call center can give support agents weekly script coaching, which may reduce customer complaint rates. But the plan uses money that could fund a different customer support need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the coaching slides use blue headers, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The plan may help support agents, but another useful need may get less support from the same resources.	**D.** The decision should focus only on whether the plan might reduce customer complaint rates, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 56

Level 2

The water utility can send automatic household water-leak alerts, which may reduce average household water use. But the plan uses money that could fund a different utilities need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the water-leak alert screen includes a blue droplet icon, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce average household water use, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** Both sides stay in view: possible improvement in average household water use and limited resources for other needs.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 57

Level 2

The police department can send body-camera activation reminders before patrol shifts, which may reduce missing-camera-footage reports. But the plan uses money that could fund a different governance need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce missing-camera-footage reports, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the reminder tone is two beeps, because concrete details are easier to inspect than resource limits.
C. The tradeoff is that the plan may reduce missing-camera-footage reports, but it also has the resource cost named in the prompt.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 58

Level 2

The election office can offer online mail-ballot tracking, which may reduce phone calls asking ballot status. But the plan uses money that could fund a different election administration need. Which statement best names the tradeoff?

A. The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the ballot-tracking page uses county colors, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce phone calls asking ballot status, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 59

Level 2

The tutoring app can send spaced-review prompts for language vocabulary, which may increase vocabulary retention quiz scores. But the plan uses money that could fund a different learning need. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the review prompts use a bell icon, because concrete details are easier to inspect than resource limits.
C. The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.	**D.** The decision should focus only on whether the plan might increase vocabulary retention quiz scores, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 60

Level 2

The gym can offer a beginner gym orientation, which may reduce new-member cancellations. But the plan uses money that could fund a different fitness need. Which statement best names the tradeoff?

A. The possible help is real, but the plan may push another need or group aside while resources are limited.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the orientation mats are black, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce new-member cancellations, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 61

Level 2

The insurer can send weekly safe-driving feedback, which may reduce reported minor crashes. But the plan uses money that could fund a different insurance need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the feedback dashboard uses star ratings, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce reported minor crashes, while leaving costs and resource limits for later.	**D.** The possible improvement is weighed against the resource limit described in the prompt, not only the upside.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 62

Level 2

The newsroom can place corrections at the top of articles, which may increase reader trust ratings. But the plan uses money that could fund a different media need. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the correction box has a gray border, because concrete details are easier to inspect than resource limits.	**B.** The possible gain is increasing reader trust ratings, and the cost is the resource limit described in the prompt.
C. The decision should focus only on whether the plan might increase reader trust ratings, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 63

Level 2

The farmers market can require clearer price signs at vendor stalls, which may reduce price disputes. But the plan uses money that could fund a different local commerce need. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce price disputes, while leaving costs and resource limits for later.	**B.** The tradeoff compares the result people want with the resources the plan would take from other work.
C. The main tradeoff is the visible side detail: the stall price signs are laminated, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 64

Level 2

The hotel can send quiet-hours text reminders to hotel guests, which may reduce noise complaints from guest rooms. But the plan uses money that could fund a different hospitality need. Which statement best names the tradeoff?

A. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce noise complaints from guest rooms, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the quiet-hours text reminder uses a small moon icon, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

The city council can extend evening bus service until midnight, which may reduce late-shift commute complaints. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce late-shift commute complaints, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the new buses were repainted blue, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 66

Level 3

The school board can require phone lockers during class, which may reduce classroom disruption reports. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce classroom disruption reports, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the lockers are installed near the gym, because concrete details are easier to inspect than resource limits.
C. One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 67

Level 3

The hospital can send medication reminder texts before evening doses, which may reduce missed-dose reports. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the text messages use a green pill icon, because concrete details are easier to inspect than resource limits.	**B.** The hoped-for gain and the resource limit are both part of the same choice, not separate questions.
C. The decision should focus only on whether the plan might reduce missed-dose reports, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 68

Level 3

The company can test a Monday-through-Thursday workweek, which may reduce staff resignations. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The tradeoff is between reducing staff resignations and the resource cost named in the prompt.	**B.** The decision should focus only on whether the plan might reduce staff resignations, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the test calendar starts on a Monday, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 69

Level 3

The grocery chain can add larger unit-price labels on shelf tags, which may reduce shopper overpayment complaints. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce shopper overpayment complaints, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the shelf labels use bold black numbers, because concrete details are easier to inspect than resource limits.	**D.** The tradeoff compares the result people want with the resources the plan would take from other work.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 70

Level 3

The library can waive late fines for children's books, which may increase library card renewals. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase library card renewals, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the children's-book checkout desk moved six feet, because concrete details are easier to inspect than resource limits.
C. The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 71

Level 3

The platform can require two-factor login for site administrators, which may reduce admin account takeovers. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision trades a possible gain for site administrators against what may be delayed elsewhere.
C. The decision should focus only on whether the plan might reduce admin account takeovers, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the login button changed from green to blue, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 72

Level 3

The neighborhood association can add brighter LED streetlights on Maple Street, which may reduce reported thefts. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The upside is reducing reported thefts; the limit is that resources still have to be shared.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the new light poles are made of aluminum, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce reported thefts, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 73

Level 3

The university can expand peer tutoring in statistics, which may increase course pass rates. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the tutoring room has new chairs, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might increase course pass rates, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The university might get a better result, but only by accepting the resource cost described in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 74

Level 3

The restaurant group can show calorie labels on printed lunch menus, which may reduce dessert orders. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lunch menus are printed on thicker paper, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. Reducing dessert orders matters, but so do the resources used by the plan and not used elsewhere.	**D.** The decision should focus only on whether the plan might reduce dessert orders, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 75

Level 3

The bank can send overdraft warning texts before fees post, which may reduce overdraft fees. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The result could improve, but that does not erase the cost side of the decision.	**B.** The decision should focus only on whether the plan might reduce overdraft fees, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the warning texts arrive from a short code, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 76

Level 3

The park service can use timed-entry passes for weekend trail visits, which may reduce trail crowding complaints. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** Choosing this plan may help one problem while leaving less support for another useful need.
C. The main tradeoff is the visible side detail: the digital passes include a small trail map, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce trail crowding complaints, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 77

Level 3

The museum can offer free admission on Fridays, which may increase family visits. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the Friday tickets are scanned at the east door, because concrete details are easier to inspect than resource limits.
C. The plan may improve something important, but it still has to compete with other needs for limited support.	**D.** The decision should focus only on whether the plan might increase family visits, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 78

Level 3

The sports league can add mandatory sideline concussion checks, which may reduce repeat head injuries. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the concussion checklist is printed on yellow paper, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce repeat head injuries, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The plan could help with repeat head injuries, but it would also use limited resources named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 79

Level 3

The nonprofit can send donation receipts within one day, which may increase donor retention. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might increase donor retention, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the receipt email subject line changed, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 80

Level 3

The warehouse can offer monthly lifting-safety and ergonomic training, which may reduce back-injury claims. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** A fair judgment counts both the possible improvement in back-injury claims and the resources the plan would use.
C. The decision should focus only on whether the plan might reduce back-injury claims, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the training room has a ceiling-mounted projector, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 81

Level 3

The city sanitation office can place compost bins in apartment lobbies, which may reduce landfill waste from participating buildings. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lobby compost bins have foot pedals, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce landfill waste from participating buildings, while leaving costs and resource limits for later.
C. The plan may help apartment residents, but another useful need may get less support from the same resources.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 82

Level 3

The app maker can make new user profiles private by default, which may reduce publicly visible profiles. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the privacy screen uses a shield icon, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce publicly visible profiles, while leaving costs and resource limits for later.	**D.** Both sides stay in view: possible improvement in publicly visible profiles and limited resources for other needs.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 83

Level 3

The clinic can reserve same-day appointment slots, which may reduce patient no-show rates. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The tradeoff is that the plan may reduce patient no-show rates, but it also has the resource cost named in the prompt.	**B.** The decision should focus only on whether the plan might reduce patient no-show rates, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the appointment cards are white, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 84

Level 3

The airline can board passengers by seat zone, which may reduce average boarding time. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The question is whether reducing average boarding time is worth the resources the plan would use, not just whether the benefit sounds good.
C. The decision should focus only on whether the plan might reduce average boarding time, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the gate signs are backlit, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 85

Level 3

The landlord can launch an online apartment repair portal, which may reduce unresolved repair requests. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the repair portal uses a house logo, because concrete details are easier to inspect than resource limits.	**B.** The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce unresolved repair requests, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 86

Level 3

The cafeteria can move fruit bowls to the front of the cafeteria line, which may increase fruit purchases. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The possible help is real, but the plan may push another need or group aside while resources are limited.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the fruit bowls are ceramic, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might increase fruit purchases, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 87

Level 3

The call center can give support agents weekly script coaching, which may reduce customer complaint rates. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the coaching slides use blue headers, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce customer complaint rates, while leaving costs and resource limits for later.	**D.** The possible improvement is weighed against the resource limit described in the prompt, not only the upside.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 88

Level 3

The water utility can send automatic household water-leak alerts, which may reduce average household water use. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the water-leak alert screen includes a blue droplet icon, because concrete details are easier to inspect than resource limits.
C. The possible gain is reducing average household water use, and the cost is the resource limit described in the prompt.	**D.** The decision should focus only on whether the plan might reduce average household water use, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 89

Level 3

The police department can send body-camera activation reminders before patrol shifts, which may reduce missing-camera-footage reports. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce missing-camera-footage reports, while leaving costs and resource limits for later.	**B.** The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the reminder tone is two beeps, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 90

Level 3

The election office can offer online mail-ballot tracking, which may reduce phone calls asking ballot status. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**B.** The decision should focus only on whether the plan might reduce phone calls asking ballot status, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the ballot-tracking page uses county colors, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 91

Level 3

The tutoring app can send spaced-review prompts for language vocabulary, which may increase vocabulary retention quiz scores. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the review prompts use a bell icon, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.	**D.** The decision should focus only on whether the plan might increase vocabulary retention quiz scores, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 92

Level 3

The gym can offer a beginner gym orientation, which may reduce new-member cancellations. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The hoped-for gain and the resource limit are both part of the same choice, not separate questions.	**B.** The main tradeoff is the visible side detail: the orientation mats are black, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce new-member cancellations, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 93

Level 3

The insurer can send weekly safe-driving feedback, which may reduce reported minor crashes. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce reported minor crashes, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the feedback dashboard uses star ratings, because concrete details are easier to inspect than resource limits.	**D.** The tradeoff is between reducing reported minor crashes and the resource cost named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 94

Level 3

The newsroom can place corrections at the top of articles, which may increase reader trust ratings. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the correction box has a gray border, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The tradeoff compares the result people want with the resources the plan would take from other work.	**D.** The decision should focus only on whether the plan might increase reader trust ratings, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 95

Level 3

The farmers market can require clearer price signs at vendor stalls, which may reduce price disputes. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce price disputes, while leaving costs and resource limits for later.	**B.** The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the stall price signs are laminated, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 96

Level 3

The hotel can send quiet-hours text reminders to hotel guests, which may reduce noise complaints from guest rooms. But the plan may move resources away from a smaller group that was not included in the test. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the quiet-hours text reminder uses a small moon icon, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce noise complaints from guest rooms, while leaving costs and resource limits for later.	**D.** The decision trades a possible gain for overnight hotel guests against what may be delayed elsewhere.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

The city council can extend evening bus service until midnight, which may reduce late-shift commute complaints. But the plan could create extra work for people who already handle other transportation tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the new buses were repainted blue, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision trades a possible gain for late-shift workers against what may be delayed elsewhere.	**D.** The decision should focus only on whether the plan might reduce late-shift commute complaints, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 98

Level 4

The school board can require phone lockers during class, which may reduce classroom disruption reports. But the plan could create extra work for people who already handle other education tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lockers are installed near the gym, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce classroom disruption reports, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The upside is reducing classroom disruption reports; the limit is that resources still have to be shared.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 99

Level 4

The hospital can send medication reminder texts before evening doses, which may reduce missed-dose reports. But the plan could create extra work for people who already handle other health tasks. Which statement best names the tradeoff?

A. The hospital might get a better result, but only by accepting the resource cost described in the prompt.	**B.** The decision should focus only on whether the plan might reduce missed-dose reports, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the text messages use a green pill icon, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 100

Level 4

The company can test a Monday-through-Thursday workweek, which may reduce staff resignations. But the plan could create extra work for people who already handle other workplace tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** Reducing staff resignations matters, but so do the resources used by the plan and not used elsewhere.
C. The decision should focus only on whether the plan might reduce staff resignations, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the test calendar starts on a Monday, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 101

Level 4

The grocery chain can add larger unit-price labels on shelf tags, which may reduce shopper overpayment complaints. But the plan could create extra work for people who already handle other retail tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce shopper overpayment complaints, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.	**D.** The main tradeoff is the visible side detail: the shelf labels use bold black numbers, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 102

Level 4

The library can waive late fines for children's books, which may increase library card renewals. But the plan could create extra work for people who already handle other public services tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase library card renewals, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the children's-book checkout desk moved six feet, because concrete details are easier to inspect than resource limits.	**D.** Choosing this plan may help one problem while leaving less support for another useful need.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 103

Level 4

The platform can require two-factor login for site administrators, which may reduce admin account takeovers. But the plan could create extra work for people who already handle other technology tasks. Which statement best names the tradeoff?

A. The plan may improve something important, but it still has to compete with other needs for limited support.	**B.** The decision should focus only on whether the plan might reduce admin account takeovers, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the login button changed from green to blue, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 104

Level 4

The neighborhood association can add brighter LED streetlights on Maple Street, which may reduce reported thefts. But the plan could create extra work for people who already handle other public safety tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the new light poles are made of aluminum, because concrete details are easier to inspect than resource limits.	**B.** The plan could help with reported thefts, but it would also use limited resources named in the prompt.
C. The decision should focus only on whether the plan might reduce reported thefts, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 105

Level 4

The university can expand peer tutoring in statistics, which may increase course pass rates. But the plan could create extra work for people who already handle other education tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the tutoring room has new chairs, because concrete details are easier to inspect than resource limits.
C. The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.	**D.** The decision should focus only on whether the plan might increase course pass rates, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 106

Level 4

The restaurant group can show calorie labels on printed lunch menus, which may reduce dessert orders. But the plan could create extra work for people who already handle other nutrition tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce dessert orders, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the lunch menus are printed on thicker paper, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The result could improve, but that does not erase the cost side of the decision.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 107

Level 4

The bank can send overdraft warning texts before fees post, which may reduce overdraft fees. But the plan could create extra work for people who already handle other finance tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce overdraft fees, while leaving costs and resource limits for later.	**B.** The plan may help checking-account customers, but another useful need may get less support from the same resources.
C. The main tradeoff is the visible side detail: the warning texts arrive from a short code, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 108

Level 4

The park service can use timed-entry passes for weekend trail visits, which may reduce trail crowding complaints. But the plan could create extra work for people who already handle other environment tasks. Which statement best names the tradeoff?

A. Both sides stay in view: possible improvement in trail crowding complaints and limited resources for other needs.	**B.** The decision should focus only on whether the plan might reduce trail crowding complaints, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the digital passes include a small trail map, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 109

Level 4

The museum can offer free admission on Fridays, which may increase family visits. But the plan could create extra work for people who already handle other culture tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the Friday tickets are scanned at the east door, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might increase family visits, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The tradeoff is that the plan may increase family visits, but it also has the resource cost named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 110

Level 4

The sports league can add mandatory sideline concussion checks, which may reduce repeat head injuries. But the plan could create extra work for people who already handle other sports tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the concussion checklist is printed on yellow paper, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The question is whether reducing repeat head injuries is worth the resources the plan would use, not just whether the benefit sounds good.	**D.** The decision should focus only on whether the plan might reduce repeat head injuries, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 111

Level 4

The nonprofit can send donation receipts within one day, which may increase donor retention. But the plan could create extra work for people who already handle other nonprofit tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase donor retention, while leaving costs and resource limits for later.	**B.** A fair judgment counts both the possible improvement in donor retention and the resources the plan would use.
C. The main tradeoff is the visible side detail: the receipt email subject line changed, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 112

Level 4

The warehouse can offer monthly lifting-safety and ergonomic training, which may reduce back-injury claims. But the plan could create extra work for people who already handle other workplace safety tasks. Which statement best names the tradeoff?

A. The possible help is real, but the plan may push another need or group aside while resources are limited.	**B.** The main tradeoff is the visible side detail: the training room has a ceiling-mounted projector, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce back-injury claims, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 113

Level 4

The city sanitation office can place compost bins in apartment lobbies, which may reduce landfill waste from participating buildings. But the plan could create extra work for people who already handle other environment tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce landfill waste from participating buildings, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the lobby compost bins have foot pedals, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The possible improvement is weighed against the resource limit described in the prompt, not only the upside.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 114

Level 4

The app maker can make new user profiles private by default, which may reduce publicly visible profiles. But the plan could create extra work for people who already handle other technology tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce publicly visible profiles, while leaving costs and resource limits for later.
C. The possible gain is reducing publicly visible profiles, and the cost is the resource limit described in the prompt.	**D.** The main tradeoff is the visible side detail: the privacy screen uses a shield icon, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 115

Level 4

The clinic can reserve same-day appointment slots, which may reduce patient no-show rates. But the plan could create extra work for people who already handle other health tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce patient no-show rates, while leaving costs and resource limits for later.	**B.** The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.
C. The main tradeoff is the visible side detail: the appointment cards are white, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 116

Level 4

The airline can board passengers by seat zone, which may reduce average boarding time. But the plan could create extra work for people who already handle other travel tasks. Which statement best names the tradeoff?

A. The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.	**B.** The main tradeoff is the visible side detail: the gate signs are backlit, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce average boarding time, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 117

Level 4

The landlord can launch an online apartment repair portal, which may reduce unresolved repair requests. But the plan could create extra work for people who already handle other housing tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce unresolved repair requests, while leaving costs and resource limits for later.
C. One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.	**D.** The main tradeoff is the visible side detail: the repair portal uses a house logo, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 118

Level 4

The cafeteria can move fruit bowls to the front of the cafeteria line, which may increase fruit purchases. But the plan could create extra work for people who already handle other food tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the fruit bowls are ceramic, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might increase fruit purchases, while leaving costs and resource limits for later.	**D.** The hoped-for gain and the resource limit are both part of the same choice, not separate questions.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 119

Level 4

The call center can give support agents weekly script coaching, which may reduce customer complaint rates. But the plan could create extra work for people who already handle other customer support tasks. Which statement best names the tradeoff?

A. The tradeoff is between reducing customer complaint rates and the resource cost named in the prompt.	**B.** The decision should focus only on whether the plan might reduce customer complaint rates, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the coaching slides use blue headers, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 120

Level 4

The water utility can send automatic household water-leak alerts, which may reduce average household water use. But the plan could create extra work for people who already handle other utilities tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce average household water use, while leaving costs and resource limits for later.	**B.** The tradeoff compares the result people want with the resources the plan would take from other work.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the water-leak alert screen includes a blue droplet icon, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 121

Level 4

The police department can send body-camera activation reminders before patrol shifts, which may reduce missing-camera-footage reports. But the plan could create extra work for people who already handle other governance tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce missing-camera-footage reports, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**D.** The main tradeoff is the visible side detail: the reminder tone is two beeps, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 122

Level 4

The election office can offer online mail-ballot tracking, which may reduce phone calls asking ballot status. But the plan could create extra work for people who already handle other election administration tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the ballot-tracking page uses county colors, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce phone calls asking ballot status, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The decision trades a possible gain for mail voters against what may be delayed elsewhere.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 123

Level 4

The tutoring app can send spaced-review prompts for language vocabulary, which may increase vocabulary retention quiz scores. But the plan could create extra work for people who already handle other learning tasks. Which statement best names the tradeoff?

A. The upside is increasing vocabulary retention quiz scores; the limit is that resources still have to be shared.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might increase vocabulary retention quiz scores, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the review prompts use a bell icon, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 124

Level 4

The gym can offer a beginner gym orientation, which may reduce new-member cancellations. But the plan could create extra work for people who already handle other fitness tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The gym might get a better result, but only by accepting the resource cost described in the prompt.
C. The decision should focus only on whether the plan might reduce new-member cancellations, while leaving costs and resource limits for later.	**D.** The main tradeoff is the visible side detail: the orientation mats are black, because concrete details are easier to inspect than resource limits.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 125

Level 4

The insurer can send weekly safe-driving feedback, which may reduce reported minor crashes. But the plan could create extra work for people who already handle other insurance tasks. Which statement best names the tradeoff?

A. Reducing reported minor crashes matters, but so do the resources used by the plan and not used elsewhere.	**B.** The main tradeoff is the visible side detail: the feedback dashboard uses star ratings, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce reported minor crashes, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 126

Level 4

The newsroom can place corrections at the top of articles, which may increase reader trust ratings. But the plan could create extra work for people who already handle other media tasks. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase reader trust ratings, while leaving costs and resource limits for later.	**B.** The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.
C. The main tradeoff is the visible side detail: the correction box has a gray border, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 127

Level 4

The farmers market can require clearer price signs at vendor stalls, which may reduce price disputes. But the plan could create extra work for people who already handle other local commerce tasks. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce price disputes, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the stall price signs are laminated, because concrete details are easier to inspect than resource limits.	**D.** Choosing this plan may help one problem while leaving less support for another useful need.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 128

Level 4

The hotel can send quiet-hours text reminders to hotel guests, which may reduce noise complaints from guest rooms. But the plan could create extra work for people who already handle other hospitality tasks. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the quiet-hours text reminder uses a small moon icon, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce noise complaints from guest rooms, while leaving costs and resource limits for later.
C. The plan may improve something important, but it still has to compete with other needs for limited support.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

The city council can extend evening bus service until midnight, which may reduce late-shift commute complaints. But the plan may help late-shift workers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the new buses were repainted blue, because concrete details are easier to inspect than resource limits.	**B.** The plan may improve something important, but it still has to compete with other needs for limited support.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce late-shift commute complaints, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 130

Level 5

The school board can require phone lockers during class, which may reduce classroom disruption reports. But the plan may help ninth-grade students while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the lockers are installed near the gym, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce classroom disruption reports, while leaving costs and resource limits for later.	**D.** The plan could help with classroom disruption reports, but it would also use limited resources named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 131

Level 5

The hospital can send medication reminder texts before evening doses, which may reduce missed-dose reports. But the plan may help patients over 60 while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce missed-dose reports, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the text messages use a green pill icon, because concrete details are easier to inspect than resource limits.	**D.** The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 132

Level 5

The company can test a Monday-through-Thursday workweek, which may reduce staff resignations. But the plan may help software engineers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce staff resignations, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The result could improve, but that does not erase the cost side of the decision.	**D.** The main tradeoff is the visible side detail: the test calendar starts on a Monday, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 133

Level 5

The grocery chain can add larger unit-price labels on shelf tags, which may reduce shopper overpayment complaints. But the plan may help weekly grocery shoppers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce shopper overpayment complaints, while leaving costs and resource limits for later.	**B.** Choosing this plan may help one problem while leaving less support for another useful need.
C. The main tradeoff is the visible side detail: the shelf labels use bold black numbers, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 134

Level 5

The library can waive late fines for children's books, which may increase library card renewals. But the plan may help families checking out children's books while making another group's problem wait longer. Which statement best names the tradeoff?

A. Both sides stay in view: possible improvement in library card renewals and limited resources for other needs.	**B.** The main tradeoff is the visible side detail: the children's-book checkout desk moved six feet, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might increase library card renewals, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 135

Level 5

The platform can require two-factor login for site administrators, which may reduce admin account takeovers. But the plan may help site administrators while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the login button changed from green to blue, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The decision should focus only on whether the plan might reduce admin account takeovers, while leaving costs and resource limits for later.	**D.** The tradeoff is that the plan may reduce admin account takeovers, but it also has the resource cost named in the prompt.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 136

Level 5

The neighborhood association can add brighter LED streetlights on Maple Street, which may reduce reported thefts. But the plan may help residents on Maple Street while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce reported thefts, while leaving costs and resource limits for later.
C. The question is whether reducing reported thefts is worth the resources the plan would use, not just whether the benefit sounds good.	**D.** The main tradeoff is the visible side detail: the new light poles are made of aluminum, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 137

Level 5

The university can expand peer tutoring in statistics, which may increase course pass rates. But the plan may help first-year statistics students while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase course pass rates, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the tutoring room has new chairs, because concrete details are easier to inspect than resource limits.	**D.** A fair judgment counts both the possible improvement in course pass rates and the resources the plan would use.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 138

Level 5

The restaurant group can show calorie labels on printed lunch menus, which may reduce dessert orders. But the plan may help lunch customers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lunch menus are printed on thicker paper, because concrete details are easier to inspect than resource limits.	**B.** The plan may help lunch customers, but another useful need may get less support from the same resources.
C. The benefit alone should settle the decision.	**D.** The decision should focus only on whether the plan might reduce dessert orders, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 139

Level 5

The bank can send overdraft warning texts before fees post, which may reduce overdraft fees. But the plan may help checking-account customers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The possible improvement is weighed against the resource limit described in the prompt, not only the upside.	**B.** The main tradeoff is the visible side detail: the warning texts arrive from a short code, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce overdraft fees, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 140

Level 5

The park service can use timed-entry passes for weekend trail visits, which may reduce trail crowding complaints. But the plan may help weekend trail hikers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce trail crowding complaints, while leaving costs and resource limits for later.	**B.** The possible gain is reducing trail crowding complaints, and the cost is the resource limit described in the prompt.
C. The main tradeoff is the visible side detail: the digital passes include a small trail map, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 141

Level 5

The museum can offer free admission on Fridays, which may increase family visits. But the plan may help local families while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might increase family visits, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The hoped-for result has to be weighed against the resources the prompt says the plan would use, instead of ignoring limits.	**D.** The main tradeoff is the visible side detail: the Friday tickets are scanned at the east door, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 142

Level 5

The sports league can add mandatory sideline concussion checks, which may reduce repeat head injuries. But the plan may help youth soccer players while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the concussion checklist is printed on yellow paper, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce repeat head injuries, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The benefit matters, but the resource cost named in the prompt also has to be counted in the same decision.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 143

Level 5

The nonprofit can send donation receipts within one day, which may increase donor retention. But the plan may help first-time donors while making another group's problem wait longer. Which statement best names the tradeoff?

A. The possible help is real, but the plan may push another need or group aside while resources are limited.	**B.** The main tradeoff is the visible side detail: the receipt email subject line changed, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might increase donor retention, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 144

Level 5

The warehouse can offer monthly lifting-safety and ergonomic training, which may reduce back-injury claims. But the plan may help warehouse staff while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the training room has a ceiling-mounted projector, because concrete details are easier to inspect than resource limits.	**B.** The hoped-for gain and the resource limit are both part of the same choice, not separate questions.
C. The decision should focus only on whether the plan might reduce back-injury claims, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 145

Level 5

The city sanitation office can place compost bins in apartment lobbies, which may reduce landfill waste from participating buildings. But the plan may help apartment residents while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the lobby compost bins have foot pedals, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. The tradeoff is between reducing landfill waste from participating buildings and the resource cost named in the prompt.	**D.** The decision should focus only on whether the plan might reduce landfill waste from participating buildings, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 146

Level 5

The app maker can make new user profiles private by default, which may reduce publicly visible profiles. But the plan may help new app users while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce publicly visible profiles, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the privacy screen uses a shield icon, because concrete details are easier to inspect than resource limits.	**D.** The tradeoff compares the result people want with the resources the plan would take from other work.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 147

Level 5

The clinic can reserve same-day appointment slots, which may reduce patient no-show rates. But the plan may help primary-care patients while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce patient no-show rates, while leaving costs and resource limits for later.	**B.** The benefit alone should settle the decision.
C. The upside and downside stay together: possible improvement, plus the resources used or delayed by the plan.	**D.** The main tradeoff is the visible side detail: the appointment cards are white, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 148

Level 5

The airline can board passengers by seat zone, which may reduce average boarding time. But the plan may help domestic flight passengers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The main tradeoff is the visible side detail: the gate signs are backlit, because concrete details are easier to inspect than resource limits.
C. The decision should focus only on whether the plan might reduce average boarding time, while leaving costs and resource limits for later.	**D.** One goal may improve while another worthwhile goal gets fewer resources from the same pool of limited support.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 149

Level 5

The landlord can launch an online apartment repair portal, which may reduce unresolved repair requests. But the plan may help apartment tenants while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The decision should focus only on whether the plan might reduce unresolved repair requests, while leaving costs and resource limits for later.
C. The upside is reducing unresolved repair requests; the limit is that resources still have to be shared.	**D.** The main tradeoff is the visible side detail: the repair portal uses a house logo, because concrete details are easier to inspect than resource limits.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 150

Level 5

The cafeteria can move fruit bowls to the front of the cafeteria line, which may increase fruit purchases. But the plan may help middle-school students while making another group's problem wait longer. Which statement best names the tradeoff?

A. The cafeteria might get a better result, but only by accepting the resource cost described in the prompt.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the fruit bowls are ceramic, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might increase fruit purchases, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 151

Level 5

The call center can give support agents weekly script coaching, which may reduce customer complaint rates. But the plan may help support agents while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the coaching slides use blue headers, because concrete details are easier to inspect than resource limits.	**B.** Reducing customer complaint rates matters, but so do the resources used by the plan and not used elsewhere.
C. The decision should focus only on whether the plan might reduce customer complaint rates, while leaving costs and resource limits for later.	**D.** The benefit alone should settle the decision.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 152

Level 5

The water utility can send automatic household water-leak alerts, which may reduce average household water use. But the plan may help local homeowners while making another group's problem wait longer. Which statement best names the tradeoff?

A. The plan is judged by what it may gain and by what it would use, delay, or pull from elsewhere.	**B.** The decision should focus only on whether the plan might reduce average household water use, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the water-leak alert screen includes a blue droplet icon, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 153

Level 5

The police department can send body-camera activation reminders before patrol shifts, which may reduce missing-camera-footage reports. But the plan may help patrol officers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The decision should focus only on whether the plan might reduce missing-camera-footage reports, while leaving costs and resource limits for later.	**B.** The main tradeoff is the visible side detail: the reminder tone is two beeps, because concrete details are easier to inspect than resource limits.
C. The benefit alone should settle the decision.	**D.** The decision trades a possible gain for patrol officers against what may be delayed elsewhere.

Answer: D. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is D because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

B. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

Question 154

Level 5

The election office can offer online mail-ballot tracking, which may reduce phone calls asking ballot status. But the plan may help mail voters while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the ballot-tracking page uses county colors, because concrete details are easier to inspect than resource limits.	**B.** The decision should focus only on whether the plan might reduce phone calls asking ballot status, while leaving costs and resource limits for later.
C. The plan may improve something important, but it still has to compete with other needs for limited support.	**D.** The benefit alone should settle the decision.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 155

Level 5

The tutoring app can send spaced-review prompts for language vocabulary, which may increase vocabulary retention quiz scores. But the plan may help language learners while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The plan could help with vocabulary retention quiz scores, but it would also use limited resources named in the prompt.
C. The main tradeoff is the visible side detail: the review prompts use a bell icon, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might increase vocabulary retention quiz scores, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 156

Level 5

The gym can offer a beginner gym orientation, which may reduce new-member cancellations. But the plan may help new gym members while making another group's problem wait longer. Which statement best names the tradeoff?

A. The plan's possible payoff is connected to its resource cost, not judged by the payoff alone.	**B.** The benefit alone should settle the decision.
C. The main tradeoff is the visible side detail: the orientation mats are black, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce new-member cancellations, while leaving costs and resource limits for later.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 157

Level 5

The insurer can send weekly safe-driving feedback, which may reduce reported minor crashes. But the plan may help auto-insurance policyholders while making another group's problem wait longer. Which statement best names the tradeoff?

A. The result could improve, but that does not erase the cost side of the decision.	**B.** The decision should focus only on whether the plan might reduce reported minor crashes, while leaving costs and resource limits for later.
C. The benefit alone should settle the decision.	**D.** The main tradeoff is the visible side detail: the feedback dashboard uses star ratings, because concrete details are easier to inspect than resource limits.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

D. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

Question 158

Level 5

The newsroom can place corrections at the top of articles, which may increase reader trust ratings. But the plan may help newsletter readers while making another group's problem wait longer. Which statement best names the tradeoff?

A. The main tradeoff is the visible side detail: the correction box has a gray border, because concrete details are easier to inspect than resource limits.	**B.** The benefit alone should settle the decision.
C. Choosing this plan may help one problem while leaving less support for another useful need.	**D.** The decision should focus only on whether the plan might increase reader trust ratings, while leaving costs and resource limits for later.

Answer: C. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is C because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

B. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

C. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Question 159

Level 5

The farmers market can require clearer price signs at vendor stalls, which may reduce price disputes. But the plan may help weekend farmers market shoppers while making another group's problem wait longer. Which statement best names the tradeoff?

A. Both sides stay in view: possible improvement in price disputes and limited resources for other needs.	**B.** The decision should focus only on whether the plan might reduce price disputes, while leaving costs and resource limits for later.
C. The main tradeoff is the visible side detail: the stall price signs are laminated, because concrete details are easier to inspect than resource limits.	**D.** The benefit alone should settle the decision.

Answer: A. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is A because it shows what is gained and what is given up, delayed, or risked.

A. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

B. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

Question 160

Level 5

The hotel can send quiet-hours text reminders to hotel guests, which may reduce noise complaints from guest rooms. But the plan may help overnight hotel guests while making another group's problem wait longer. Which statement best names the tradeoff?

A. The benefit alone should settle the decision.	**B.** The tradeoff is that the plan may reduce noise complaints from guest rooms, but it also has the resource cost named in the prompt.
C. The main tradeoff is the visible side detail: the quiet-hours text reminder uses a small moon icon, because concrete details are easier to inspect than resource limits.	**D.** The decision should focus only on whether the plan might reduce noise complaints from guest rooms, while leaving costs and resource limits for later.

Answer: B. A tradeoff compares what you gain with what you give up or risk.

How to work it out. To uncover the answer, hold the possible gain and the possible cost in the same sentence. The correct choice is B because it shows what is gained and what is given up, delayed, or risked.

A. Not correct. A real benefit is only one side of a tradeoff. The cost, delay, or resource limit still has to be weighed.

B. Correct. This answer keeps both sides of the decision in view: what the plan might improve and what it would cost, delay, or risk.

C. Not correct. A random visible detail is not the tradeoff. The tradeoff is between the plan's possible benefit and its cost or risk.

D. Not correct. A tradeoff looks at both the possible benefit and what the plan uses, costs, or delays.

Skill 16

Update Beliefs Responsibly

How Should Belief Change?

Change confidence by the right amount. Objective	**160** Items	**Levels 1-5** Difficulty bands

Essential question	How much should new evidence change confidence?
Why it matters	Strong thinkers change confidence by the right amount. They neither ignore new evidence nor swing wildly from one result to certainty.
Conceptual core	Belief updating teaches proportion. Students should neither ignore evidence that points in a direction nor treat one small result as final proof. The skill joins direction and size: does the evidence support or weaken the claim, and is it strong enough to move confidence a little or a lot? This habit is central to intellectual humility.
Student method	Ask whether the evidence points toward or away from the claim, how strong the evidence is, and what uncertainty remains. Then move confidence a little or a lot accordingly.
Analogy	Belief updating is steering, not teleporting. New evidence should turn the wheel in proportion to its strength.
Assessment focus	A good answer names both the direction and size of the confidence change while preserving remaining uncertainty.

Teaching Sequence

1. State the prior uncertainty or starting belief.

2. Decide whether the evidence points toward or away from the claim.

3. Judge the evidence strength using sample, comparison, directness, and reliability.

4. Move confidence by an amount that fits the evidence.

Common Confusions To Watch For

1. Students may think changing confidence means fully changing sides.

2. Students may ignore weak evidence because it is not conclusive.

3. Students may overreact to one vivid case or small test.

Teacher Prompts

1. Which direction does the evidence point?

2. How strong is it?

3. What uncertainty remains after we update?

Worked Example

Scenario	You are unsure whether brighter lights reduce theft reports. A small matched test finds reports fell from 50 to 44 over the same period nearby streets stayed about the same.
Teacher think-aloud	The evidence points toward the lights helping, and the comparison makes it more useful. But it is still one small test, so confidence should increase somewhat, not jump to certainty.
Student takeaway	Responsible updating changes belief in proportion to evidence strength.

Guided Classroom Exercise

Invented case. Use only the facts below; write on paper. Try the steps and check your work before reading the model answer. Different wording can be equally adequate.

Situation. You begin unsure whether brighter streetlights reduce theft reports. Study A is one resident saying a street feels safer. Study B assigns 40 similar streets at random to brighter or unchanged lighting, keeps patrol policy the same, and records the same theft measure before and after: reports fall more in the brighter-light group. No exact effect size or uncertainty estimate is supplied.

What To Do

1. For each study, say whether it should raise, lower, or leave your confidence roughly unchanged, and explain why.

2. Choose which should change confidence more, using the difference between personal impressions and a controlled comparison.

3. Name one missing detail you would seek before making a strong conclusion. Do not invent a precise percentage change in confidence.

Check before reading the answer. Have you updated more for the stronger relevant evidence while keeping uncertainty about the size and reliability of the effect?

Model Answer

Study A should change confidence about theft reports very little: feeling safer is a different outcome and one person's impression. Study B should raise confidence more because random assignment and consistent measurement provide a fairer comparison of the claimed outcome. I would request the size of the difference and its uncertainty before making a strong claim.

Why it is adequate. It ties the direction and strength of the update to evidence quality and acknowledges that the scenario cannot justify an exact confidence number.

Item Bank

Items are grouped by level. For each item, read the prompt, predict the answer, choose, and then use the feedback and process commentary to examine the reasoning path.

Level 1

Level 1 establishes the clean version of the skill: the cue is direct, the distractors are visible, and the main task is to learn the contrast.

Question 1

Level 1

You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints fell by 22% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Raise confidence somewhat, while staying open to better evidence.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 2

Level 1

You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you see a random comparison using two similar groups. In the group that used the plan, classroom disruption reports fell by 31% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Raise confidence a lot, while still avoiding total certainty.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 3

Level 1

You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports rose by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Lower confidence somewhat, while staying open to better evidence.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 4

Level 1

You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn that the test calendar starts on a Monday. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works.	**B.** Treat the side detail as strong evidence.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 5

Level 1

You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints fell by 27% compared with the four weeks before the test. You also learn that a local consumer group ran a price-literacy campaign. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 6

Level 1

You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals rose by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Shift your confidence upward a bit, because the test helps but does not settle the question.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 7

Level 1

You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you see a random comparison using two similar groups. In the group that used the plan, admin account takeovers fell by 44% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Treat the comparison as just a story.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Become much more confident, but do not treat one comparison as perfect proof.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 8

Level 1

You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts rose by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Dismiss the negative result as background noise.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 9

Level 1

You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn that the tutoring room has new chairs. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Treat the side detail as strong evidence.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Do not change confidence much, because the new detail is not evidence about the result.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 10

Level 1

You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders fell by 16% compared with the four weeks before the test. You also learn that dessert prices increased at the same time. How should your confidence in that claim change?

A. Make only a slight upward update, since the result helps but the other change weakens the update.	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Treat the possible other cause as settling the issue.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 11

Level 1

You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees fell by 24% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Treat the test as strong proof.
C. Become somewhat more confident, while remembering that one small test is limited.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 12

Level 1

You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you see a random comparison using two similar groups. In the group that used the plan, trail crowding complaints fell by 33% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Give the claim a strong boost because the comparison makes the evidence much better.
C. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**D.** Treat the comparison as just a story.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 13

Level 1

You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits fell by 29% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat less confident, while remembering that one small test is limited.	**B.** Dismiss the negative result as background noise.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 14

Level 1

You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn that the concussion checklist is printed on yellow paper. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Treat the side detail as strong evidence.	**D.** Leave confidence mostly where it was, since the detail does not check the claim.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 15

Level 1

You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention rose by 14% compared with the four weeks before the test. You also learn that the nonprofit also launched a matching campaign. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.
C. Adjust upward a bit, while taking the competing explanation seriously.	**D.** Treat the possible other cause as settling the issue.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 16

Level 1

You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims fell by 20% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Treat the result as support for the claim, but keep looking for stronger evidence.
C. Treat the test as strong proof.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 17

Level 1

You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you see a random comparison using two similar groups. In the group that used the plan, landfill waste from participating buildings fell by 17% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Make a sharp upward update, while leaving room for future evidence to matter.	**B.** Treat the comparison as just a story.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 18

Level 1

You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles rose by 48% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Dismiss the negative result as background noise.	**D.** Treat the result as evidence against the claim, but not as final disproof.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 19

Level 1

You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn that the appointment cards are white. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Treat the side detail as strong evidence.
C. Treat the detail as mostly irrelevant to whether the plan causes the result.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 20

Level 1

You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time fell by 9% compared with the four weeks before the test. You also learn that the airline also reduced carry-on size limits. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Treat the result as some support, but keep the update small because of the other change.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Treat the possible other cause as settling the issue.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 21

Level 1

You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests fell by 26% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Make a modest upward update because the result points the right way but is still small.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 22

Level 1

You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you see a random comparison using two similar groups. In the group that used the plan, fruit purchases rose by 23% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the claim as much more likely, though not guaranteed in every setting.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Treat the comparison as just a story.	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

Question 23

Level 1

You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates rose by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Decrease confidence modestly because the result points the wrong way but is still small.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Dismiss the negative result as background noise.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 24

Level 1

You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn that the water-leak alert screen includes a blue droplet icon. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Treat the side detail as strong evidence.
C. Avoid moving confidence much because the detail does not bear on the claim.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 25

Level 1

You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports fell by 35% compared with the four weeks before the test. You also learn that the department also updated supervisor reviews. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Become only a little more confident because the helpful result has another possible cause.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 26

Level 1

You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status fell by 42% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence.	**B.** Treat the test as strong proof.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 27

Level 1

You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you see a random comparison using two similar groups. In the group that used the plan, vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Raise confidence a lot, while still avoiding total certainty.
C. Treat the comparison as just a story.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 28

Level 1

You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations rose by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Lower confidence somewhat, while staying open to better evidence.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 29

Level 1

You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn that the feedback dashboard uses star ratings. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Treat the side detail as strong evidence.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Keep confidence about the same, because that detail does not test whether the plan works.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 30

Level 1

You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings rose by 7% compared with the four weeks before the test. You also learn that the newsroom also hired a public editor. How should your confidence in that claim change?

A. Nudge confidence upward only a little, because the result helps but another change could explain it.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Treat the possible other cause as settling the issue.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 31

Level 1

You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes fell by 28% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Treat the test as strong proof.
C. Shift your confidence upward a bit, because the test helps but does not settle the question.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 32

Level 1

You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you see a random comparison using two similar groups. In the group that used the plan, noise complaints from guest rooms fell by 30% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Become much more confident, but do not treat one comparison as perfect proof.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Level 2

Level 2 keeps the same skill but adds more realistic wording and more tempting distractors.

Question 33

Level 2

You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you see a random comparison using two similar groups. In the group that used the plan, late-shift commute complaints fell by 22% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Treat the comparison as just a story.
C. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**D.** Become much more confident, but do not treat one comparison as perfect proof.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 34

Level 2

You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports rose by 31% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Shift your confidence downward a bit, because the test counts against the claim but is small.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 35

Level 2

You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn that the text messages use a green pill icon. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Do not change confidence much, because the new detail is not evidence about the result.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Treat the side detail as strong evidence.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 36

Level 2

You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations fell by 15% compared with the four weeks before the test. You also learn that the company also raised salaries that quarter. How should your confidence in that claim change?

A. Make only a slight upward update, since the result helps but the other change weakens the update.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Treat the possible other cause as settling the issue.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 37

Level 2

You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints fell by 27% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Shift your confidence upward a bit, because the test helps but does not settle the question.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 38

Level 2

You are unsure whether waiving late fines for children's books would increase library card renewals. Then you see a random comparison using two similar groups. In the group that used the plan, library card renewals rose by 19% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Treat the comparison as just a story.
C. Give the claim a strong boost because the comparison makes the evidence much better.	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

Question 39

Level 2

You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers rose by 44% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Become somewhat less confident, while remembering that one small test is limited.
C. Dismiss the negative result as background noise.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 40

Level 2

You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn that the new light poles are made of aluminum. How should your confidence in that claim change?

A. Leave confidence mostly where it was, since the detail does not check the claim.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 41

Level 2

You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates rose by 11% compared with the four weeks before the test. You also learn that the final exam was also shortened. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Adjust upward a bit, while taking the competing explanation seriously.
C. Treat the possible other cause as settling the issue.	**D.** Ignore the result completely because another change happened too, even though the result still points the right way.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 42

Level 2

You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders fell by 16% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat more confident, while remembering that one small test is limited.	**B.** Treat the test as strong proof.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 43

Level 2

You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you see a random comparison using two similar groups. In the group that used the plan, overdraft fees fell by 24% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Make a sharp upward update, while leaving room for future evidence to matter.	**D.** Treat the comparison as just a story.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 44

Level 2

You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints rose by 33% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Treat the result as evidence against the claim, but not as final disproof.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 45

Level 2

You are unsure whether offering free admission on Fridays would increase family visits. Then you learn that the Friday tickets are scanned at the east door. How should your confidence in that claim change?

A. Treat the detail as mostly irrelevant to whether the plan causes the result.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 46

Level 2

You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries fell by 21% compared with the four weeks before the test. You also learn that the league also shortened the season. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Treat the result as some support, but keep the update small because of the other change.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Ignore the result completely because another change happened too, even though the result still points the right way.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 47

Level 2

You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention rose by 14% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Keep confidence exactly the same, because one small test can never matter.
C. Treat the result as support for the claim, but keep looking for stronger evidence.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 48

Level 2

You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you see a random comparison using two similar groups. In the group that used the plan, back-injury claims fell by 20% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Treat the comparison as just a story.	**D.** Treat the claim as much more likely, though not guaranteed in every setting.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 49

Level 2

You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings rose by 17% compared with the four weeks before the test. How should your confidence in that claim change?

A. Decrease confidence modestly because the result points the wrong way but is still small.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Dismiss the negative result as background noise.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 50

Level 2

You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn that the privacy screen uses a shield icon. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Avoid moving confidence much because the detail does not bear on the claim.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 51

Level 2

You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates fell by 13% compared with the four weeks before the test. You also learn that the clinic also began reminder calls. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Treat the possible other cause as settling the issue.
C. Become only a little more confident because the helpful result has another possible cause.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 52

Level 2

You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time fell by 9% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Keep confidence exactly the same, because one small test can never matter.
C. Treat the test as strong proof.	**D.** Make a modest upward update because the result points the right way but is still small.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 53

Level 2

You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you see a random comparison using two similar groups. In the group that used the plan, unresolved repair requests fell by 26% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Raise confidence a lot, while still avoiding total certainty.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Treat the comparison as just a story.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 54

Level 2

You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases fell by 23% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence somewhat, while staying open to better evidence.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Dismiss the negative result as background noise.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 55

Level 2

You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn that the coaching slides use blue headers. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Treat the side detail as strong evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Keep confidence about the same, because that detail does not test whether the plan works.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 56

Level 2

You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use fell by 10% compared with the four weeks before the test. You also learn that a rainy season began during the study. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Treat the possible other cause as settling the issue.
C. Nudge confidence upward only a little, because the result helps but another change could explain it.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 57

Level 2

You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports fell by 35% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Raise confidence somewhat, while staying open to better evidence.
C. Treat the test as strong proof.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 58

Level 2

You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you see a random comparison using two similar groups. In the group that used the plan, phone calls asking ballot status fell by 42% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Become much more confident, but do not treat one comparison as perfect proof.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Treat the comparison as just a story.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 59

Level 2

You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores fell by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Dismiss the negative result as background noise.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Shift your confidence downward a bit, because the test counts against the claim but is small.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 60

Level 2

You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn that the orientation mats are black. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Do not change confidence much, because the new detail is not evidence about the result.	**D.** Treat the side detail as strong evidence.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 61

Level 2

You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes fell by 8% compared with the four weeks before the test. You also learn that fuel prices changed driving patterns that month. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Make only a slight upward update, since the result helps but the other change weakens the update.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Treat the possible other cause as settling the issue.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 62

Level 2

You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings rose by 7% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question.	**B.** Keep confidence exactly the same, because one small test can never matter.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Treat the test as strong proof.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 63

Level 2

You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you see a random comparison using two similar groups. In the group that used the plan, price disputes fell by 28% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Give the claim a strong boost because the comparison makes the evidence much better.	**D.** Treat the comparison as just a story.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 64

Level 2

You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms rose by 30% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Dismiss the negative result as background noise.	**D.** Become somewhat less confident, while remembering that one small test is limited.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Level 3

Level 3 asks for steadier discrimination: the right answer is still objective, but the wrong answers often sound plausible.

Question 65

Level 3

You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints rose by 22% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Become somewhat less confident, while remembering that one small test is limited.
C. Dismiss the negative result as background noise.	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 66

Level 3

You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn that the lockers are installed near the gym. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Leave confidence mostly where it was, since the detail does not check the claim.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 67

Level 3

You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports fell by 18% compared with the four weeks before the test. You also learn that pharmacists also began follow-up calls. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.
C. Treat the possible other cause as settling the issue.	**D.** Adjust upward a bit, while taking the competing explanation seriously.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 68

Level 3

You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations fell by 15% compared with the four weeks before the test. How should your confidence in that claim change?

A. Become somewhat more confident, while remembering that one small test is limited.	**B.** Treat the test as strong proof.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 69

Level 3

You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you see a random comparison using two similar groups. In the group that used the plan, shopper overpayment complaints fell by 27% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Give the claim a strong boost because the comparison makes the evidence much better.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Treat the comparison as just a story.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 70

Level 3

You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals fell by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Treat the result as evidence against the claim, but not as final disproof.	**D.** Dismiss the negative result as background noise.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 71

Level 3

You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn that the login button changed from green to blue. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 72

Level 3

You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts fell by 12% compared with the four weeks before the test. You also learn that police patrols increased during the same period. How should your confidence in that claim change?

A. Treat the result as some support, but keep the update small because of the other change.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Treat the possible other cause as settling the issue.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 73

Level 3

You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates rose by 11% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Treat the result as support for the claim, but keep looking for stronger evidence.
C. Treat the test as strong proof.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 74

Level 3

You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you see a random comparison using two similar groups. In the group that used the plan, dessert orders fell by 16% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Make a sharp upward update, while leaving room for future evidence to matter.	**D.** Treat the comparison as just a story.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 75

Level 3

You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees rose by 24% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Decrease confidence modestly because the result points the wrong way but is still small.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 76

Level 3

You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn that the digital passes include a small trail map. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Avoid moving confidence much because the detail does not bear on the claim.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the side detail as strong evidence.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 77

Level 3

You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits rose by 29% compared with the four weeks before the test. You also learn that a new children's exhibit opened the same week. How should your confidence in that claim change?

A. Become only a little more confident because the helpful result has another possible cause.	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Treat the possible other cause as settling the issue.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 78

Level 3

You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries fell by 21% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Treat the test as strong proof.	**D.** Make a modest upward update because the result points the right way but is still small.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 79

Level 3

You are unsure whether sending donation receipts within one day would increase donor retention. Then you see a random comparison using two similar groups. In the group that used the plan, donor retention rose by 14% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Treat the claim as much more likely, though not guaranteed in every setting.	**D.** Treat the comparison as just a story.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 80

Level 3

You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims rose by 20% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Lower confidence somewhat, while staying open to better evidence.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Dismiss the negative result as background noise.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 81

Level 3

You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn that the lobby compost bins have foot pedals. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 82

Level 3

You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles fell by 48% compared with the four weeks before the test. You also learn that the app also deleted inactive accounts. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Treat the possible other cause as settling the issue.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Nudge confidence upward only a little, because the result helps but another change could explain it.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 83

Level 3

You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates fell by 13% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Treat the test as strong proof.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 84

Level 3

You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you see a random comparison using two similar groups. In the group that used the plan, average boarding time fell by 9% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Treat the comparison as just a story.	**D.** Raise confidence a lot, while still avoiding total certainty.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 85

Level 3

You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests rose by 26% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Shift your confidence downward a bit, because the test counts against the claim but is small.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Dismiss the negative result as background noise.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 86

Level 3

You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn that the fruit bowls are ceramic. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Treat the side detail as strong evidence.
C. Do not change confidence much, because the new detail is not evidence about the result.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 87

Level 3

You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates fell by 18% compared with the four weeks before the test. You also learn that the call queue was also shortened. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Treat the possible other cause as settling the issue.	**D.** Make only a slight upward update, since the result helps but the other change weakens the update.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 88

Level 3

You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use fell by 10% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question.	**B.** Keep confidence exactly the same, because one small test can never matter.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Treat the test as strong proof.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 89

Level 3

You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you see a random comparison using two similar groups. In the group that used the plan, missing-camera-footage reports fell by 35% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Become much more confident, but do not treat one comparison as perfect proof.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Treat the comparison as just a story.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 90

Level 3

You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status rose by 42% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Become somewhat less confident, while remembering that one small test is limited.	**D.** Dismiss the negative result as background noise.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 91

Level 3

You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn that the review prompts use a bell icon. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Leave confidence mostly where it was, since the detail does not check the claim.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 92

Level 3

You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations fell by 19% compared with the four weeks before the test. You also learn that the gym also discounted annual plans. How should your confidence in that claim change?

A. Adjust upward a bit, while taking the competing explanation seriously.	**B.** Treat the possible other cause as settling the issue.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 93

Level 3

You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes fell by 8% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the test as strong proof.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Become somewhat more confident, while remembering that one small test is limited.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 94

Level 3

You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you see a random comparison using two similar groups. In the group that used the plan, reader trust ratings rose by 7% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better.	**B.** Treat the comparison as just a story.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 95

Level 3

You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes rose by 28% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Treat the result as evidence against the claim, but not as final disproof.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 96

Level 3

You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn that the quiet-hours text reminder uses a small moon icon. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Treat the detail as mostly irrelevant to whether the plan causes the result.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the side detail as strong evidence.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Level 4

Level 4 asks learners to hold more context in mind while applying the same method.

Question 97

Level 4

You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn that the new buses were repainted blue. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Treat the side detail as strong evidence.	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 98

Level 4

You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports fell by 31% compared with the four weeks before the test. You also learn that a new hall monitor schedule began at the same time. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Treat the result as some support, but keep the update small because of the other change.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 99

Level 4

You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you learn about one small four-week test where missed-dose reports fell by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Treat the result as support for the claim, but keep looking for stronger evidence.
C. Treat the test as strong proof.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 100

Level 4

You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you see a random comparison using two similar groups. In the group that used the plan, staff resignations fell by 15% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Make a sharp upward update, while leaving room for future evidence to matter.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Treat the comparison as just a story.	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

Question 101

Level 4

You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn about one small four-week test where shopper overpayment complaints rose by 27% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Dismiss the negative result as background noise.	**D.** Treat the result as evidence against the claim, but not as final disproof.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 102

Level 4

You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn that the children's-book checkout desk moved six feet. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Avoid moving confidence much because the detail does not bear on the claim.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 103

Level 4

You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers fell by 44% compared with the four weeks before the test. You also learn that some high-risk admin accounts were removed earlier. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Become only a little more confident because the helpful result has another possible cause.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 104

Level 4

You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you learn about one small four-week test where reported thefts fell by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Make a modest upward update because the result points the right way but is still small.	**B.** Treat the test as strong proof.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 105

Level 4

You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you see a random comparison using two similar groups. In the group that used the plan, course pass rates rose by 11% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Treat the comparison as just a story.	**D.** Treat the claim as much more likely, though not guaranteed in every setting.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 106

Level 4

You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn about one small four-week test where dessert orders rose by 16% compared with the four weeks before the test. How should your confidence in that claim change?

A. Dismiss the negative result as background noise.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Decrease confidence modestly because the result points the wrong way but is still small.	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 107

Level 4

You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn that the warning texts arrive from a short code. How should your confidence in that claim change?

A. Keep confidence about the same, because that detail does not test whether the plan works.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Treat the side detail as strong evidence.	**D.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

Question 108

Level 4

You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints fell by 33% compared with the four weeks before the test. You also learn that a nearby trail reopened that month. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 109

Level 4

You are unsure whether offering free admission on Fridays would increase family visits. Then you learn about one small four-week test where family visits rose by 29% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Treat the test as strong proof.
C. Raise confidence somewhat, while staying open to better evidence.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 110

Level 4

You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you see a random comparison using two similar groups. In the group that used the plan, repeat head injuries fell by 21% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Lower confidence because comparison groups weaken evidence instead of strengthening it.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Raise confidence a lot, while still avoiding total certainty.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 111

Level 4

You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn about one small four-week test where donor retention fell by 14% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Lower confidence somewhat, while staying open to better evidence.	**D.** Dismiss the negative result as background noise.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 112

Level 4

You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn that the training room has a ceiling-mounted projector. How should your confidence in that claim change?

A. Do not change confidence much, because the new detail is not evidence about the result.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 113

Level 4

You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings fell by 17% compared with the four weeks before the test. You also learn that trash pickup schedules also changed. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Treat the possible other cause as settling the issue.
C. Make only a slight upward update, since the result helps but the other change weakens the update.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 114

Level 4

You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you learn about one small four-week test where publicly visible profiles fell by 48% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence upward a bit, because the test helps but does not settle the question.	**B.** Treat the test as strong proof.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Lower confidence because the test is small, even though its result points the right way.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 115

Level 4

You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you see a random comparison using two similar groups. In the group that used the plan, patient no-show rates fell by 13% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Treat the comparison as just a story.
C. Become much more confident, but do not treat one comparison as perfect proof.	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

Question 116

Level 4

You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn about one small four-week test where average boarding time rose by 9% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Dismiss the negative result as background noise.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 117

Level 4

You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn that the repair portal uses a house logo. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Leave confidence mostly where it was, since the detail does not check the claim.
C. Treat the side detail as strong evidence.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 118

Level 4

You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases rose by 23% compared with the four weeks before the test. You also learn that a fruit discount started that week. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Ignore the result completely because another change happened too, even though the result still points the right way.
C. Treat the possible other cause as settling the issue.	**D.** Adjust upward a bit, while taking the competing explanation seriously.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 119

Level 4

You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you learn about one small four-week test where customer complaint rates fell by 18% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Become somewhat more confident, while remembering that one small test is limited.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Treat the test as strong proof.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 120

Level 4

You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you see a random comparison using two similar groups. In the group that used the plan, average household water use fell by 10% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Treat the comparison as just a story.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 121

Level 4

You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn about one small four-week test where missing-camera-footage reports rose by 35% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Become somewhat less confident, while remembering that one small test is limited.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Dismiss the negative result as background noise.

Answer: B. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 122

Level 4

You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn that the ballot-tracking page uses county colors. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Treat the side detail as strong evidence.
C. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**D.** Treat the detail as mostly irrelevant to whether the plan causes the result.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The detail does not test the claim, so it should not move confidence much.

C. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 123

Level 4

You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. You also learn that the app also changed the quiz format. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Treat the result as some support, but keep the update small because of the other change.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Ignore the result completely because another change happened too, even though the result still points the right way.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 124

Level 4

You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you learn about one small four-week test where new-member cancellations fell by 19% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Treat the test as strong proof.	**D.** Treat the result as support for the claim, but keep looking for stronger evidence.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 125

Level 4

You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you see a random comparison using two similar groups. In the group that used the plan, reported minor crashes fell by 8% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Make a sharp upward update, while leaving room for future evidence to matter.
C. Treat the comparison as just a story.	**D.** Keep confidence unchanged because comparison groups make the result harder to summarize.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

Question 126

Level 4

You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn about one small four-week test where reader trust ratings fell by 7% compared with the four weeks before the test. How should your confidence in that claim change?

A. Treat the result as evidence against the claim, but not as final disproof.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Dismiss the negative result as background noise.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 127

Level 4

You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn that the stall price signs are laminated. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Avoid moving confidence much because the detail does not bear on the claim.	**D.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

Question 128

Level 4

You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms fell by 30% compared with the four weeks before the test. You also learn that the hotel also changed room assignments. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Treat the possible other cause as settling the issue.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Become only a little more confident because the helpful result has another possible cause.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Level 5

Level 5 is for fluency: the learner should now name the thinking move and explain the elimination path.

Question 129

Level 5

You are unsure whether extending evening bus service until midnight would reduce late-shift commute complaints. Then you learn about one small four-week test where late-shift commute complaints fell by 22% compared with the four weeks before the test. You also learn that a large employer started a private shuttle the same month. How should your confidence in that claim change?

A. Become only a little more confident because the helpful result has another possible cause.	**B.** Treat the possible other cause as settling the issue.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Ignore the result completely because another change happened too, even though the result still points the right way.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 130

Level 5

You are unsure whether requiring phone lockers during class would reduce classroom disruption reports. Then you learn about one small four-week test where classroom disruption reports fell by 31% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Make a modest upward update because the result points the right way but is still small.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Treat the test as strong proof.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 131

Level 5

You are unsure whether sending medication reminder texts before evening doses would reduce missed-dose reports. Then you see a random comparison using two similar groups. In the group that used the plan, missed-dose reports fell by 18% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Treat the claim as much more likely, though not guaranteed in every setting.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 132

Level 5

You are unsure whether testing a Monday-through-Thursday workweek would reduce staff resignations. Then you learn about one small four-week test where staff resignations rose by 15% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Dismiss the negative result as background noise.
C. Drop confidence all the way to zero, because one small test against a claim settles it.	**D.** Decrease confidence modestly because the result points the wrong way but is still small.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 133

Level 5

You are unsure whether adding larger unit-price labels on shelf tags would reduce shopper overpayment complaints. Then you learn that the shelf labels use bold black numbers. How should your confidence in that claim change?

A. Avoid moving confidence much because the detail does not bear on the claim.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 134

Level 5

You are unsure whether waiving late fines for children's books would increase library card renewals. Then you learn about one small four-week test where library card renewals rose by 19% compared with the four weeks before the test. You also learn that the library also opened on Sundays. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Treat the possible other cause as settling the issue.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 135

Level 5

You are unsure whether requiring two-factor login for site administrators would reduce admin account takeovers. Then you learn about one small four-week test where admin account takeovers fell by 44% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Treat the test as strong proof.
C. Raise confidence somewhat, while staying open to better evidence.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 136

Level 5

You are unsure whether adding brighter LED streetlights on Maple Street would reduce reported thefts. Then you see a random comparison using two similar groups. In the group that used the plan, reported thefts fell by 12% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**D.** Raise confidence a lot, while still avoiding total certainty.

Answer: D. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

Question 137

Level 5

You are unsure whether expanding peer tutoring in statistics would increase course pass rates. Then you learn about one small four-week test where course pass rates fell by 11% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Lower confidence somewhat, while staying open to better evidence.	**D.** Dismiss the negative result as background noise.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 138

Level 5

You are unsure whether showing calorie labels on printed lunch menus would reduce dessert orders. Then you learn that the lunch menus are printed on thicker paper. How should your confidence in that claim change?

A. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Treat the side detail as strong evidence.	**D.** Keep confidence about the same, because that detail does not test whether the plan works.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 139

Level 5

You are unsure whether sending overdraft warning texts before fees post would reduce overdraft fees. Then you learn about one small four-week test where overdraft fees fell by 24% compared with the four weeks before the test. You also learn that the bank also changed its fee grace period. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Make only a slight upward update, since the result helps but the other change weakens the update.
C. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**D.** Treat the possible other cause as settling the issue.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

Question 140

Level 5

You are unsure whether using timed-entry passes for weekend trail visits would reduce trail crowding complaints. Then you learn about one small four-week test where trail crowding complaints fell by 33% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because one small test can never matter.	**B.** Treat the test as strong proof.
C. Lower confidence because the test is small, even though its result points the right way.	**D.** Shift your confidence upward a bit, because the test helps but does not settle the question.

Answer: D. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

Question 141

Level 5

You are unsure whether offering free admission on Fridays would increase family visits. Then you see a random comparison using two similar groups. In the group that used the plan, family visits rose by 29% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Keep confidence unchanged because comparison groups make the result harder to summarize.	**B.** Become much more confident, but do not treat one comparison as perfect proof.
C. Treat the comparison as just a story.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 142

Level 5

You are unsure whether adding mandatory sideline concussion checks would reduce repeat head injuries. Then you learn about one small four-week test where repeat head injuries rose by 21% compared with the four weeks before the test. How should your confidence in that claim change?

A. Shift your confidence downward a bit, because the test counts against the claim but is small.	**B.** Keep confidence exactly the same, because a small negative test is never worth noticing.
C. Dismiss the negative result as background noise.	**D.** Drop confidence all the way to zero, because one small test against a claim settles it.

Answer: A. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

B. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 143

Level 5

You are unsure whether sending donation receipts within one day would increase donor retention. Then you learn that the receipt email subject line changed. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.
C. Treat the side detail as strong evidence.	**D.** Do not change confidence much, because the new detail is not evidence about the result.

Answer: D. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

Question 144

Level 5

You are unsure whether offering monthly lifting-safety and ergonomic training would reduce back-injury claims. Then you learn about one small four-week test where back-injury claims fell by 20% compared with the four weeks before the test. You also learn that new lifting equipment arrived that quarter. How should your confidence in that claim change?

A. Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.	**B.** Treat the possible other cause as settling the issue.
C. Adjust upward a bit, while taking the competing explanation seriously.	**D.** Ignore the result completely because another change happened too, even though the result still points the right way.

Answer: C. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 145

Level 5

You are unsure whether placing compost bins in apartment lobbies would reduce landfill waste from participating buildings. Then you learn about one small four-week test where landfill waste from participating buildings fell by 17% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Become somewhat more confident, while remembering that one small test is limited.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Treat the test as strong proof.

Answer: B. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 146

Level 5

You are unsure whether making new user profiles private by default would reduce publicly visible profiles. Then you see a random comparison using two similar groups. In the group that used the plan, publicly visible profiles fell by 48% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Give the claim a strong boost because the comparison makes the evidence much better.	**B.** Treat the comparison as just a story.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: A. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 147

Level 5

You are unsure whether reserving same-day appointment slots would reduce patient no-show rates. Then you learn about one small four-week test where patient no-show rates rose by 13% compared with the four weeks before the test. How should your confidence in that claim change?

A. Keep confidence exactly the same, because a small negative test is never worth noticing.	**B.** Drop confidence all the way to zero, because one small test against a claim settles it.
C. Dismiss the negative result as background noise.	**D.** Become somewhat less confident, while remembering that one small test is limited.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 148

Level 5

You are unsure whether boarding passengers by seat zone would reduce average boarding time. Then you learn that the gate signs are backlit. How should your confidence in that claim change?

A. Make a large update because any new information about the topic should move confidence, even if it is not evidence.	**B.** Leave confidence mostly where it was, since the detail does not check the claim.
C. Treat the side detail as strong evidence.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: B. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

B. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

C. Not correct. The detail does not test the claim, so it should not move confidence much.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 149

Level 5

You are unsure whether launching an online apartment repair portal would reduce unresolved repair requests. Then you learn about one small four-week test where unresolved repair requests fell by 26% compared with the four weeks before the test. You also learn that the landlord hired two additional repair technicians. How should your confidence in that claim change?

A. Treat the result as some support, but keep the update small because of the other change.	**B.** Treat the possible other cause as settling the issue.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: A. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

B. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 150

Level 5

You are unsure whether moving fruit bowls to the front of the cafeteria line would increase fruit purchases. Then you learn about one small four-week test where fruit purchases rose by 23% compared with the four weeks before the test. How should your confidence in that claim change?

A. Lower confidence because the test is small, even though its result points the right way.	**B.** Treat the test as strong proof.
C. Treat the result as support for the claim, but keep looking for stronger evidence.	**D.** Keep confidence exactly the same, because one small test can never matter.

Answer: C. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

C. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 151

Level 5

You are unsure whether giving support agents weekly script coaching would reduce customer complaint rates. Then you see a random comparison using two similar groups. In the group that used the plan, customer complaint rates fell by 18% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Treat the comparison as just a story.	**B.** Keep confidence unchanged because comparison groups make the result harder to summarize.
C. Make a sharp upward update, while leaving room for future evidence to matter.	**D.** Lower confidence because comparison groups weaken evidence instead of strengthening it.

Answer: C. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

B. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

C. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 152

Level 5

You are unsure whether sending automatic household water-leak alerts would reduce average household water use. Then you learn about one small four-week test where average household water use rose by 10% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Dismiss the negative result as background noise.
C. Keep confidence exactly the same, because a small negative test is never worth noticing.	**D.** Treat the result as evidence against the claim, but not as final disproof.

Answer: D. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

Question 153

Level 5

You are unsure whether sending body-camera activation reminders before patrol shifts would reduce missing-camera-footage reports. Then you learn that the reminder tone is two beeps. How should your confidence in that claim change?

A. Treat the side detail as strong evidence.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Treat the detail as mostly irrelevant to whether the plan causes the result.	**D.** Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.

Answer: C. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The detail does not test the claim, so it should not move confidence much.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 154

Level 5

You are unsure whether offering online mail-ballot tracking would reduce phone calls asking ballot status. Then you learn about one small four-week test where phone calls asking ballot status fell by 42% compared with the four weeks before the test. You also learn that the office also expanded its phone staff. How should your confidence in that claim change?

A. Ignore the result completely because another change happened too, even though the result still points the right way.	**B.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.
C. Treat the possible other cause as settling the issue.	**D.** Become only a little more confident because the helpful result has another possible cause.

Answer: D. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is D because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

D. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

Question 155

Level 5

You are unsure whether sending spaced-review prompts for language vocabulary would increase vocabulary retention quiz scores. Then you learn about one small four-week test where vocabulary retention quiz scores rose by 12% compared with the four weeks before the test. How should your confidence in that claim change?

A. Make a modest upward update because the result points the right way but is still small.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Treat the test as strong proof.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

Question 156

Level 5

You are unsure whether offering a beginner gym orientation would reduce new-member cancellations. Then you see a random comparison using two similar groups. In the group that used the plan, new-member cancellations fell by 19% compared with the four weeks before the test. In the group without the plan, the same result did not improve. How should your confidence in that claim change?

A. Lower confidence because comparison groups weaken evidence instead of strengthening it.	**B.** Treat the claim as much more likely, though not guaranteed in every setting.
C. Keep confidence unchanged because comparison groups make the result harder to summarize.	**D.** Treat the comparison as just a story.

Answer: B. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

B. Correct. This is the right size and direction of belief change. A fair comparison is stronger evidence, so confidence should rise more, but not to 100%.

C. Not correct. This answer updates by the wrong amount or in the wrong direction for the evidence given.

D. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

Question 157

Level 5

You are unsure whether sending weekly safe-driving feedback would reduce reported minor crashes. Then you learn about one small four-week test where reported minor crashes rose by 8% compared with the four weeks before the test. How should your confidence in that claim change?

A. Drop confidence all the way to zero, because one small test against a claim settles it.	**B.** Dismiss the negative result as background noise.
C. Decrease confidence modestly because the result points the wrong way but is still small.	**D.** Keep confidence exactly the same, because a small negative test is never worth noticing.

Answer: C. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is C because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.

B. Not correct. Evidence can be limited and still matter. The right move is to update by the right amount, not dismiss it.

C. Correct. This is the right size and direction of belief change. A small test that points the wrong way should lower confidence somewhat, but it is not final proof.

D. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

Question 158

Level 5

You are unsure whether placing corrections at the top of articles would increase reader trust ratings. Then you learn that the correction box has a gray border. How should your confidence in that claim change?

A. Avoid moving confidence much because the detail does not bear on the claim.	**B.** Make a large update because any new information about the topic should move confidence, even if it is not evidence.
C. Lower confidence because any side detail weakens the idea, even when it is unrelated to the result.	**D.** Treat the side detail as strong evidence.

Answer: A. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. Irrelevant information should not move confidence much, even when it sounds connected to the topic.

B. Not correct. Confidence should move because of relevant evidence, not just because a new detail appeared.

C. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

D. Not correct. The detail does not test the claim, so it should not move confidence much.

Question 159

Level 5

You are unsure whether requiring clearer price signs at vendor stalls would reduce price disputes. Then you learn about one small four-week test where price disputes fell by 28% compared with the four weeks before the test. You also learn that the market also added a weekend help desk. How should your confidence in that claim change?

A. Treat the possible other cause as settling the issue.	**B.** Nudge confidence upward only a little, because the result helps but another change could explain it.
C. Ignore the result completely because another change happened too, even though the result still points the right way.	**D.** Lower confidence sharply because the other change proves the plan did not help, even though the test result improved.

Answer: B. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is B because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Not correct. A possible other cause should make the update smaller, but it does not settle the issue by itself.

B. Correct. This is the right size and direction of belief change. Mixed evidence can still matter, but the possible alternative explanation should keep the update small.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

Question 160

Level 5

You are unsure whether sending quiet-hours text reminders to hotel guests would reduce noise complaints from guest rooms. Then you learn about one small four-week test where noise complaints from guest rooms fell by 30% compared with the four weeks before the test. How should your confidence in that claim change?

A. Raise confidence somewhat, while staying open to better evidence.	**B.** Lower confidence because the test is small, even though its result points the right way.
C. Keep confidence exactly the same, because one small test can never matter.	**D.** Treat the test as strong proof.

Answer: A. A small test that points the right way should raise confidence somewhat, but it is not final proof.

How to work it out. To uncover the answer, choose both the direction and the size of the confidence change. The correct choice is A because it moves belief in proportion to the evidence instead of ignoring or overreacting to it.

A. Correct. This is the right size and direction of belief change. A small test that points the right way should raise confidence somewhat, but it is not final proof.

B. Not correct. This moves confidence in the wrong direction for evidence that supports the claim.

C. Not correct. Limited or mixed evidence may deserve only a small update, but ignoring relevant evidence throws away information.

D. Not correct. The evidence may matter, but this answer overreacts by treating limited evidence as certainty.
